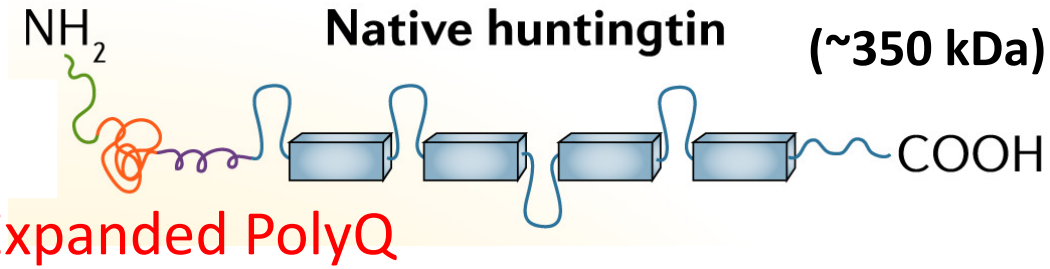
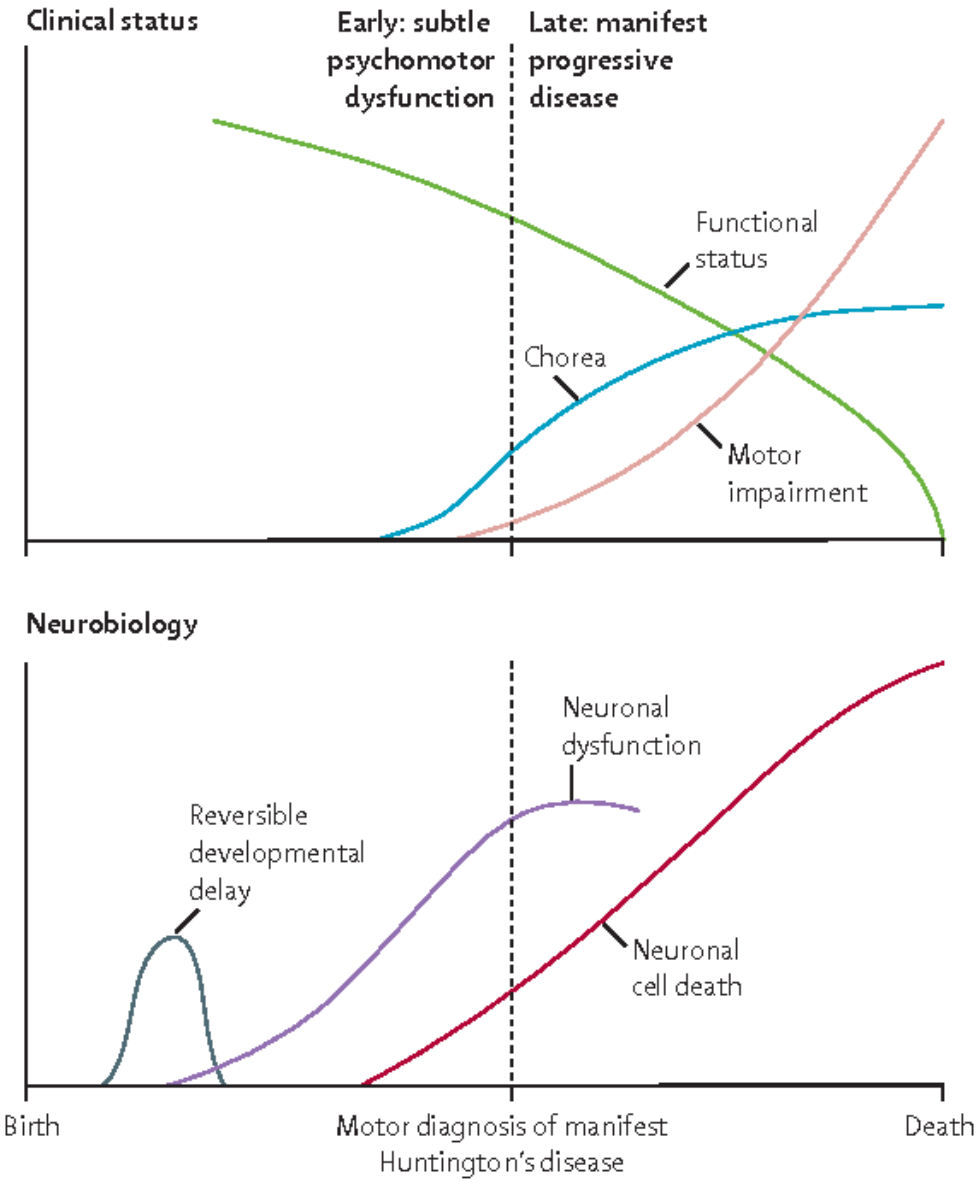
Huntington's Disease: A Polyglutamine Expansion Disorder

- Monogenic neurogenerative disorder
  → Huntingtin (Htt) gene
- Htt gene → Increased CAG repeat → Expanded polyQ



- Massive cell loss in striatum and cortex
- Liver also selective target in HD

Normal Huntington's Disease



Nat Rev Dis Primers (2015).

Questions

Biology of huntingtin (Htt) → Consequence of Htt lowering therapies?

Pathophysiology of polyQ expansion (mHTT) → Gain/loss of function?

Tissue-selective pathology → Proteome signatures of HD?

Approaches

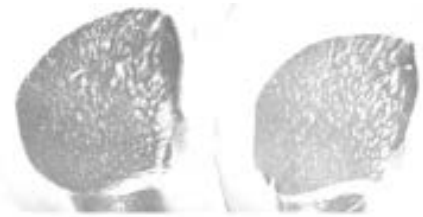
Identification of proximal disease-modifiers using discovery-based and targeted MS

Proteome dysfunction in the liver

Altered protein interaction dynamics in the brain

Defining Protein Markers of HD in Liver using Targeted MS

- Goal: Define liver proteome signatures for expanded polyQ Htt or loss of Htt
- Protein candidate selection
  - Unbiased liver proteome analysis (collected by Carroll lab & Evotec)
  - Genetic variants linked to age of disease onset (GeM-HD Consortium)
  - Diverse roles, including metabolism (34), cell adhesion (14), RNA processing/transport (16)
- Approach: Design targeted relative quantification 1D-LC assays using Skyline
  - Experimental spectra supplemented with Prosit predicted spectra (Gessulat et al., 2019)



Striatal protein marker showing cell loss

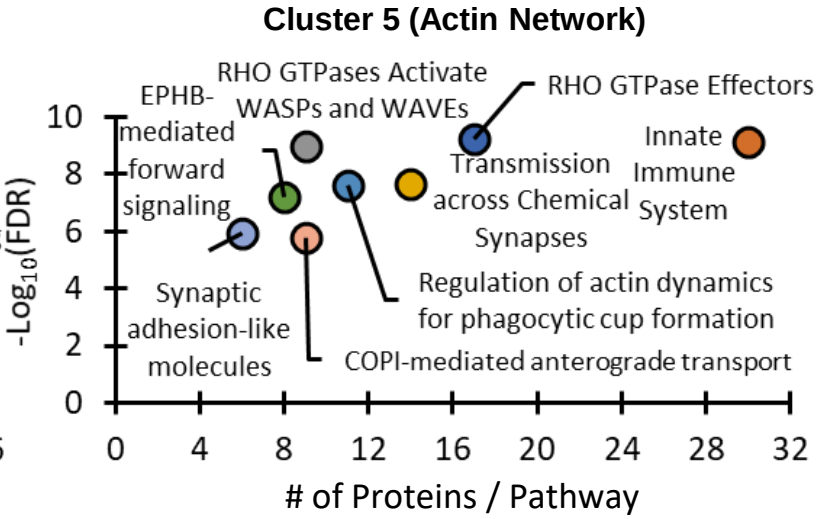
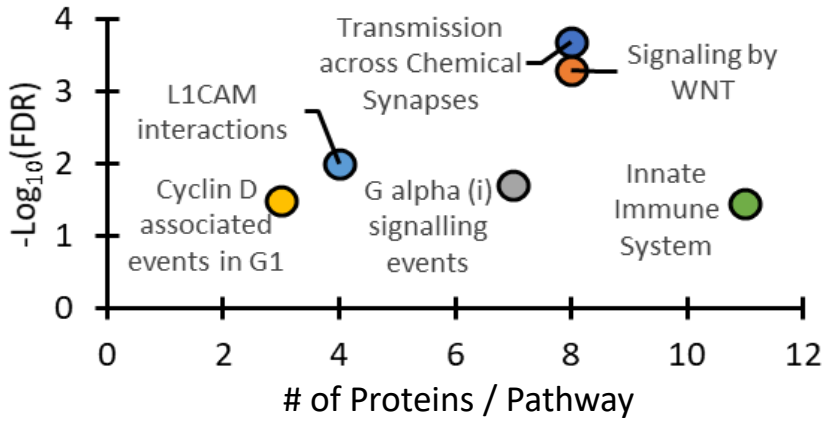
Cluster 5 (Actin Network)

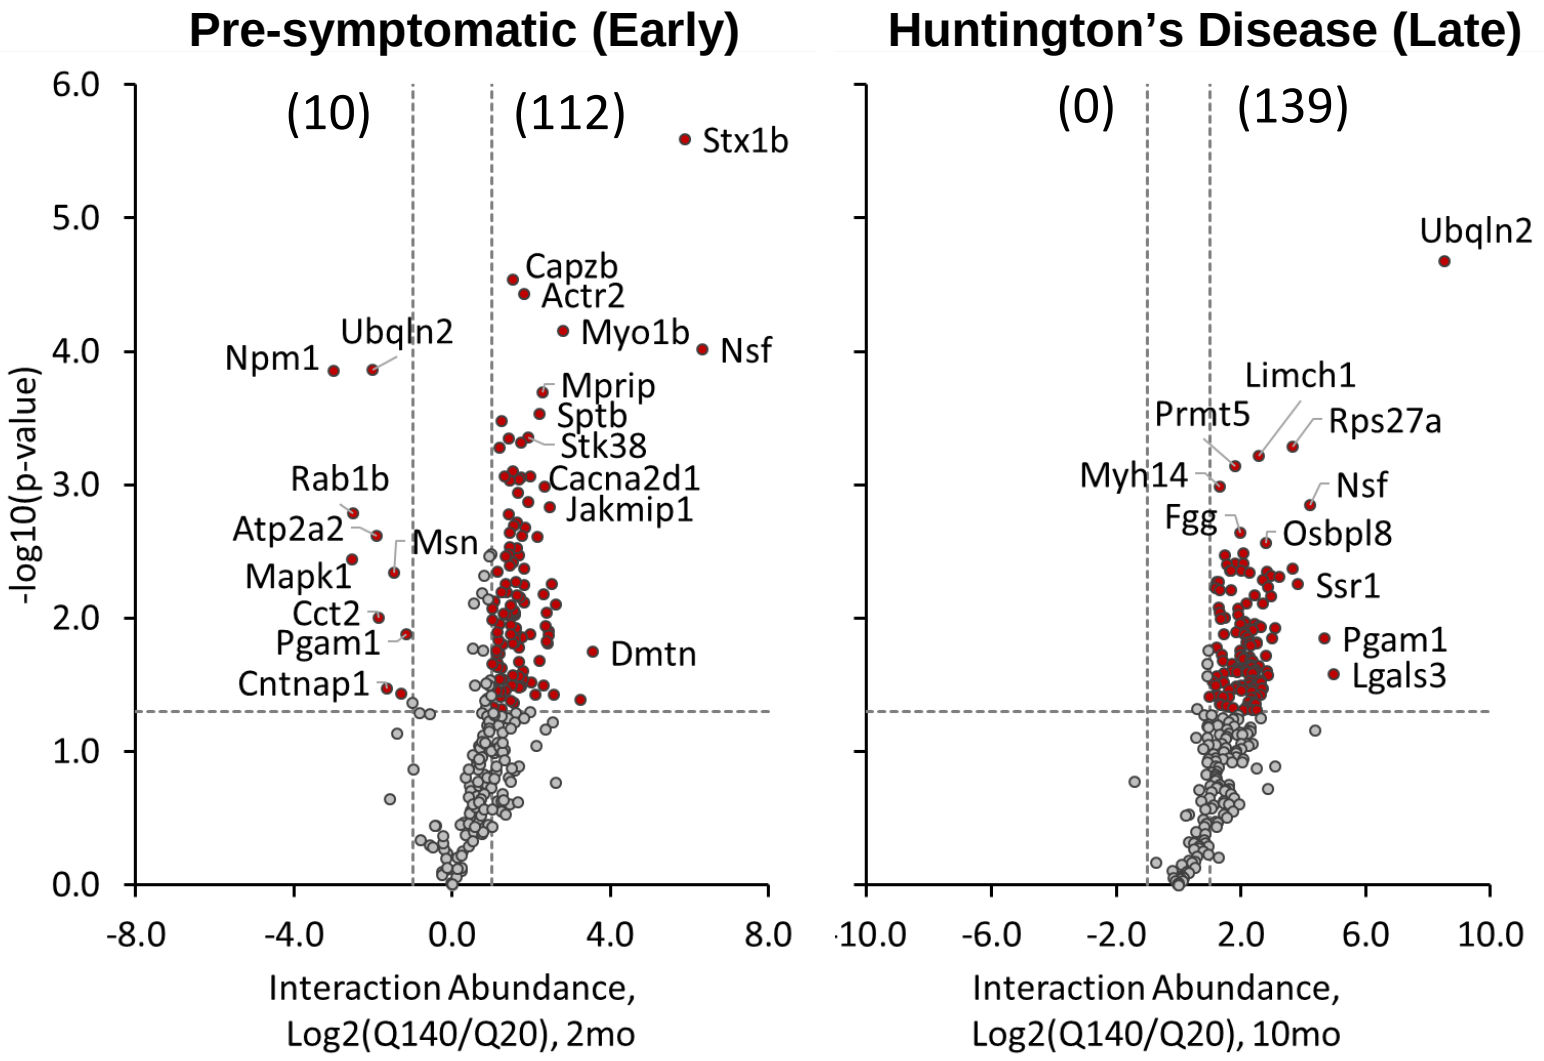


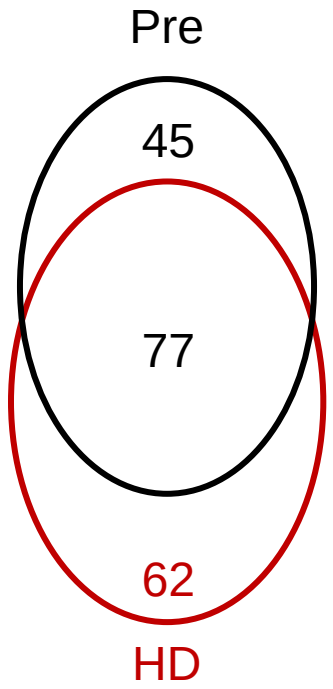
Clusters 1, 2, & 3 (Synapse Trans)



Distinct PolyQ-dependent Htt Interactions in Pre-symptomatic & HD Mice

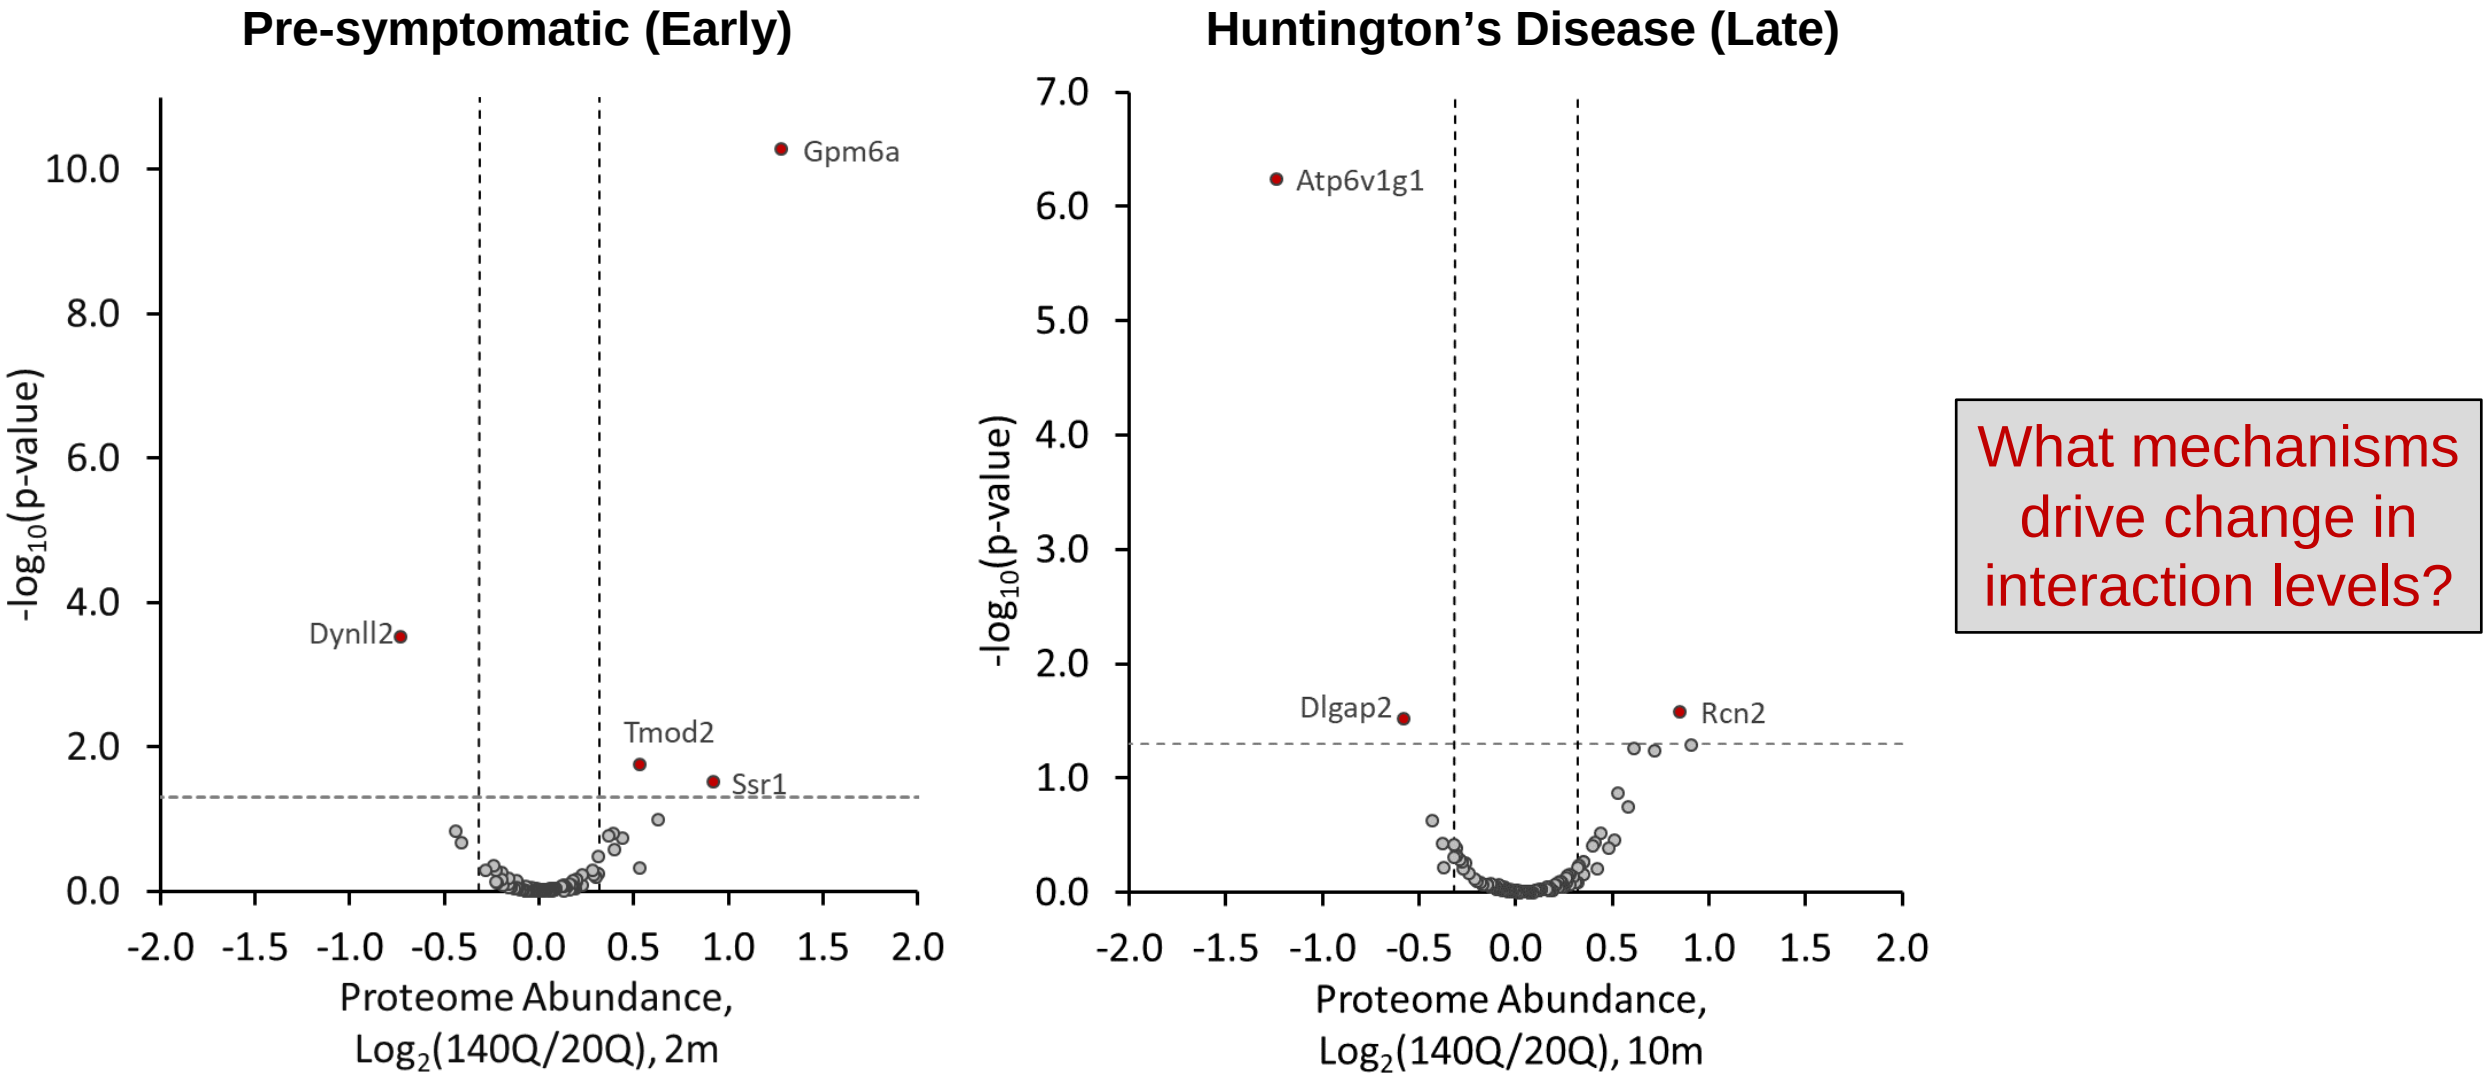
- **Increased:** **SNARE complex members**: syntaxin 1b (Stx1b), SNAP25, NEM-sensitive factor (Nsf)
- **Decreased:** **Mitogen-activated protein kinase 1** (Mapk1)
- 184 differential interactions





Contribution of proteome abundance?

PolyQ-dependent Interactions are not Driven by Proteome Abundance



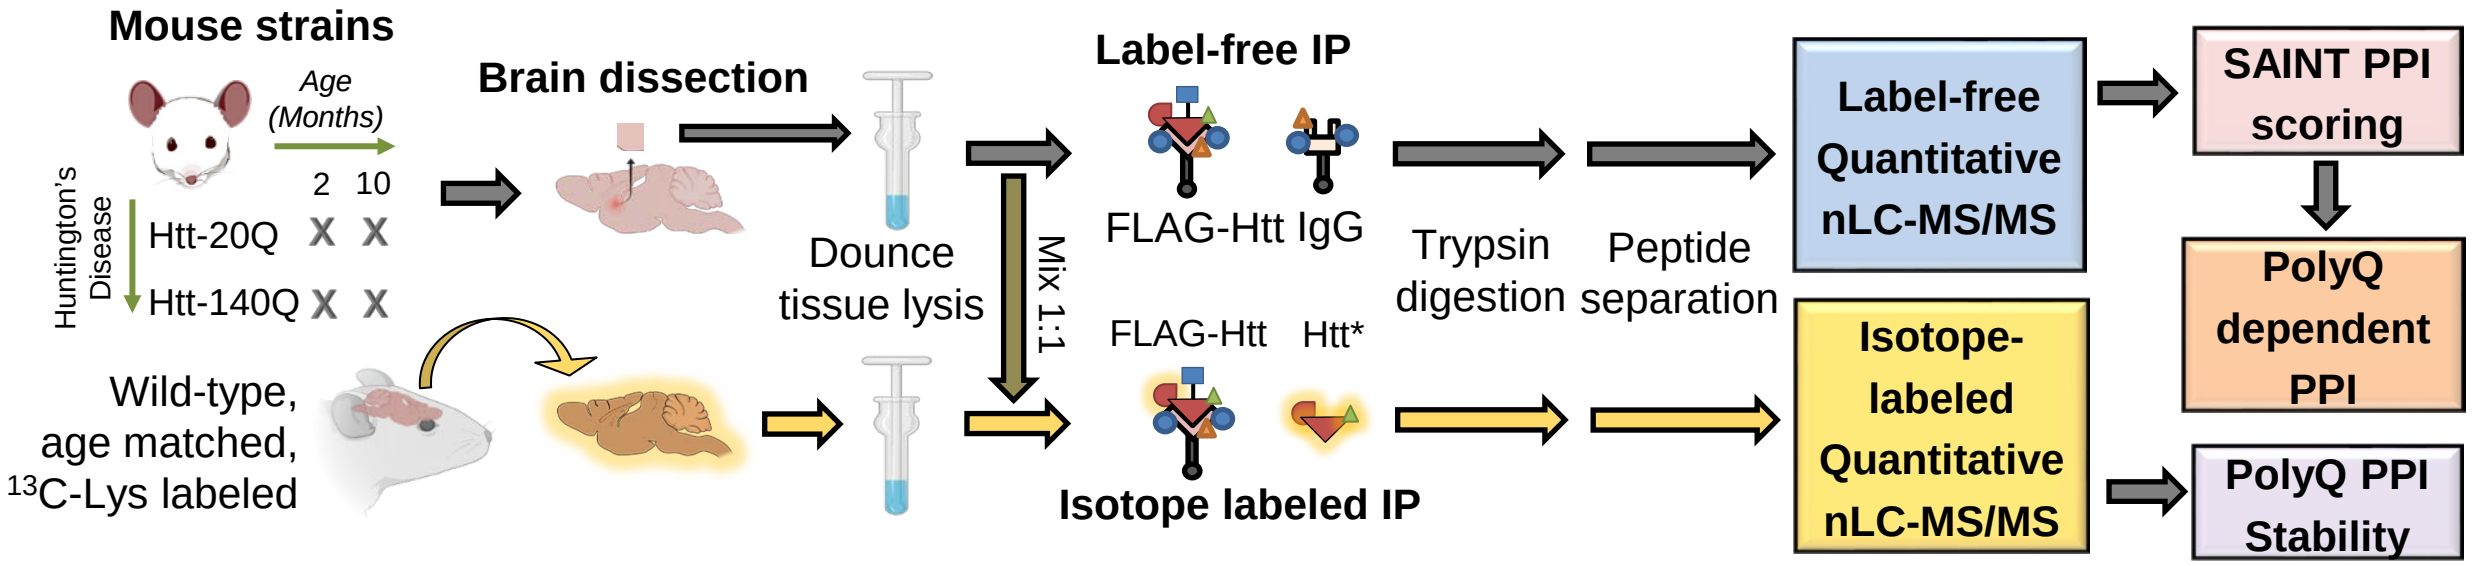
What mechanisms drive change in interaction levels?

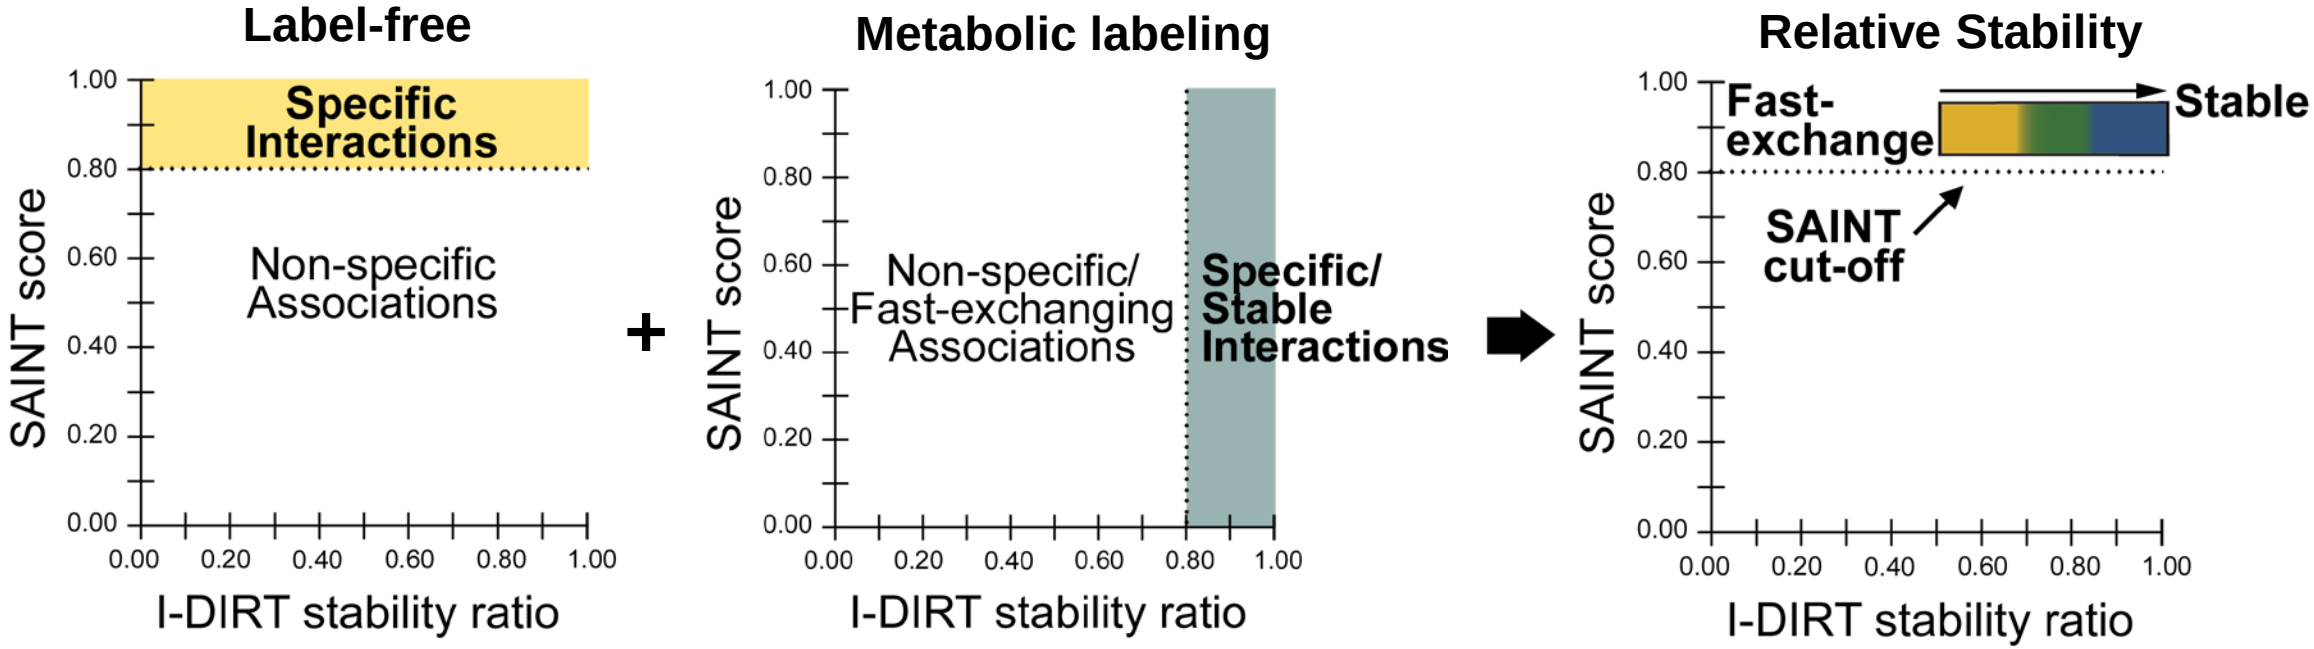
- Only 7 of the differential interactions are also regulated at the proteome level
- Similarly low overlap at the transcriptome level

Langfelder et al. (2016). *Nat. Neurosci*. 19(4).

Federpsiel et al. (2019). *Mol. Cell. Proteomics*. 18:S92-S113

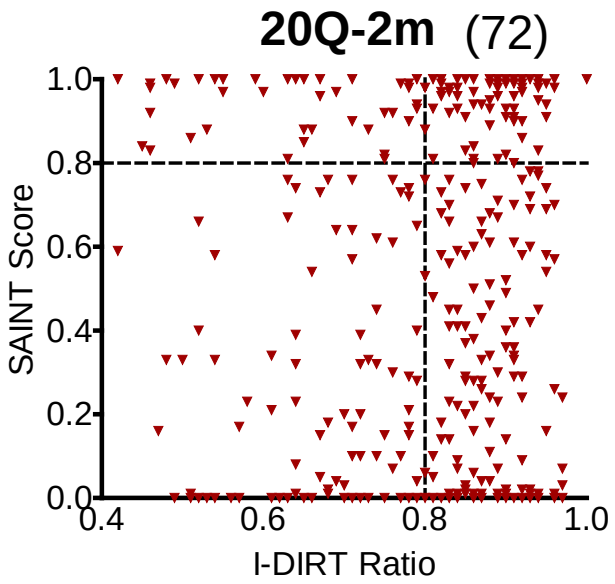
Parallel Isotope-labeled IP-MS Integrates PolyQ-dependent interaction stability

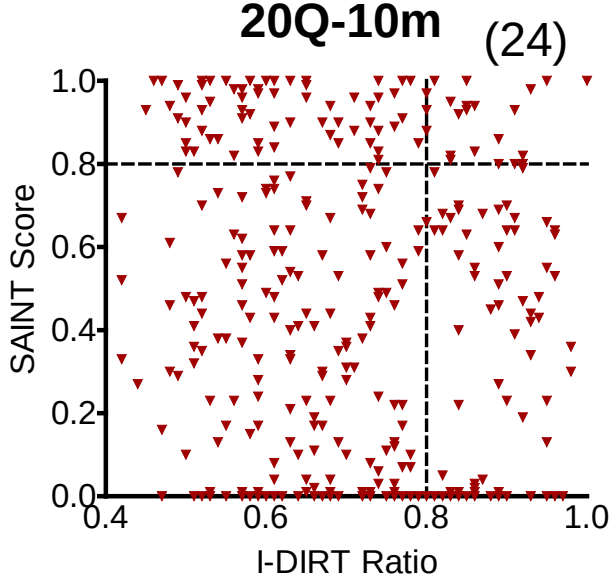


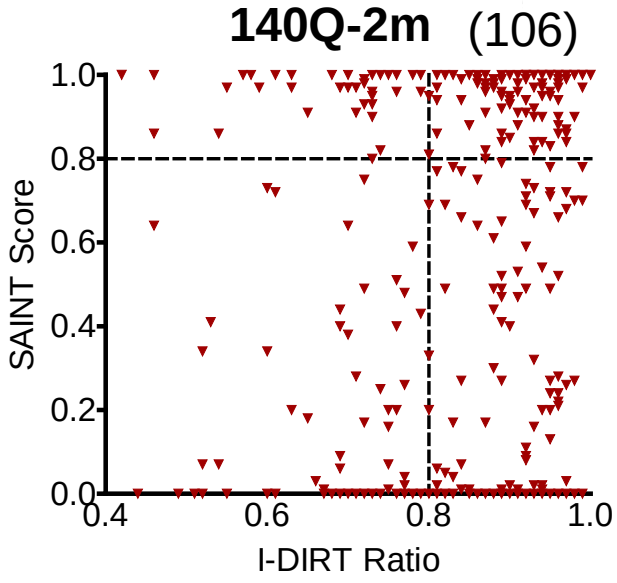


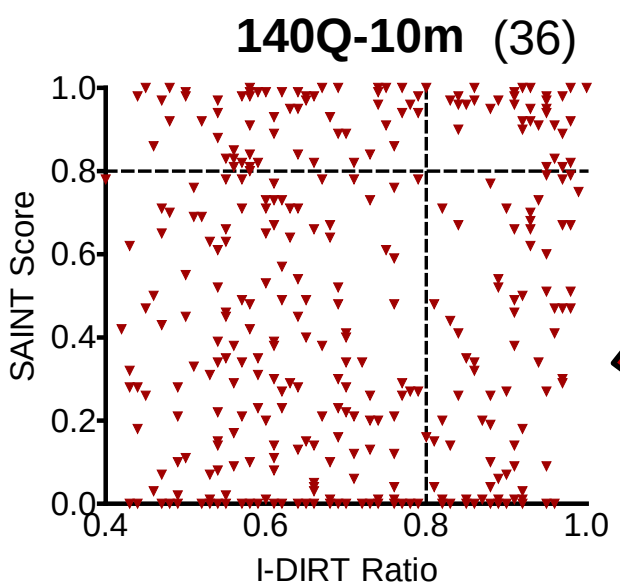
et al. (2013).
st Biol. 9:672
et al. (2015).
Methods in Mol Biol.

Interaction Relative Stabilities are PolyQ and Age Dependent









Presymptomatic PolyQ

HD manifest PolyQ

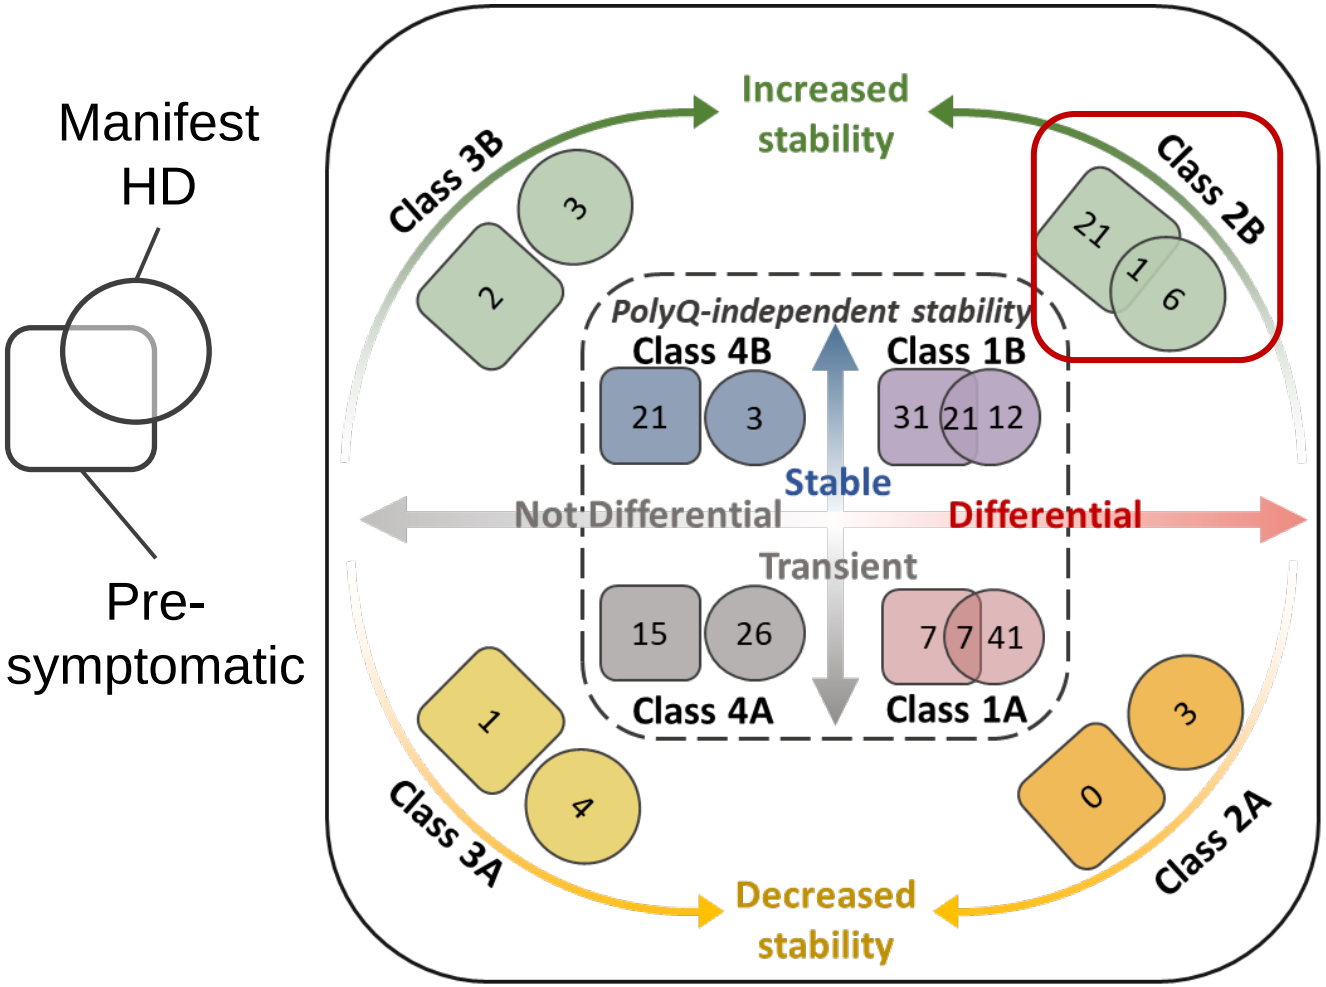
Age (Months)

Huntington's Disease	2	10
Htt-20Q	X	X
Htt-140Q	X	X

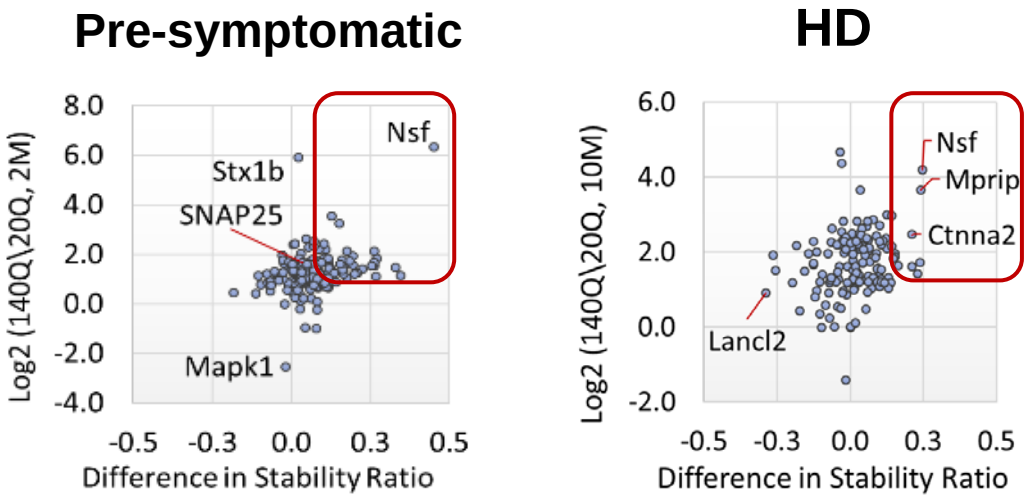
- **Age-dependent** decrease in stability
- **PolyQ-dependent** increase in stability

How to classify PPIs stabilities versus interaction levels?

PolyQ-dependent Htt Interaction Dynamics



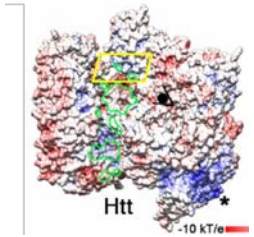
- Differential proteins > Late disease
- Differential protein + increased stability > Early disease



- Suggests functional divergence within SNARE complex at stability level

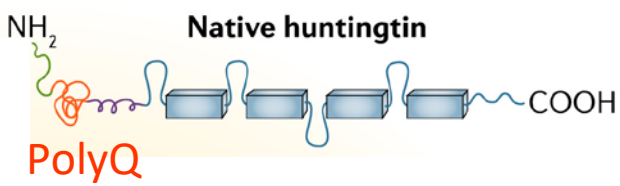
HD is a whole-body disease

Biology of normal huntingtin (Htt) → Consequence of Htt lowering therapies?



- Reinforce role of Htt in DNA repair
- Cell adhesion proteins in normal Htt function?
- Highlight proteome-interactome relationship (HAP40)

Pathophysiology of polyQ expansion (mHTT) → Gain/loss of function?



- Potential for metabolic protein dysregulation, e.g. in fatty acid synthesis
- Distinct regulation of Htt PPIs in early and late state disease
  - Differential effects of PolyQ on SNARE protein interaction levels and stability

Tissue-selective pathology → Proteome signatures of HD?

- Continued application of targeted MS assays across tissues (proteome, metabolome, and lipidome)
