Intramural Research Program
Our Research Changes Lives

ONE PROGRAM, MANY PEOPLE, INFINITE POSSIBILITIES

Translational Geroproteomics Unit (TGU)

Research Directions

1. Development of a new generation of aging biomarkers

- A. Senescence-based
- B. PTMs and Isoforms

2. Protein & proteoform turnover

3. Proteomics-Driven Approaches to Quantify, Target and Isolate Senescent Cells in Humans/Tissues

- A. Development and validation of senescence biomarkers
- B. How 'senotype' drives aging phenotypes
- C. Therapeutic targets

Matthew Payea

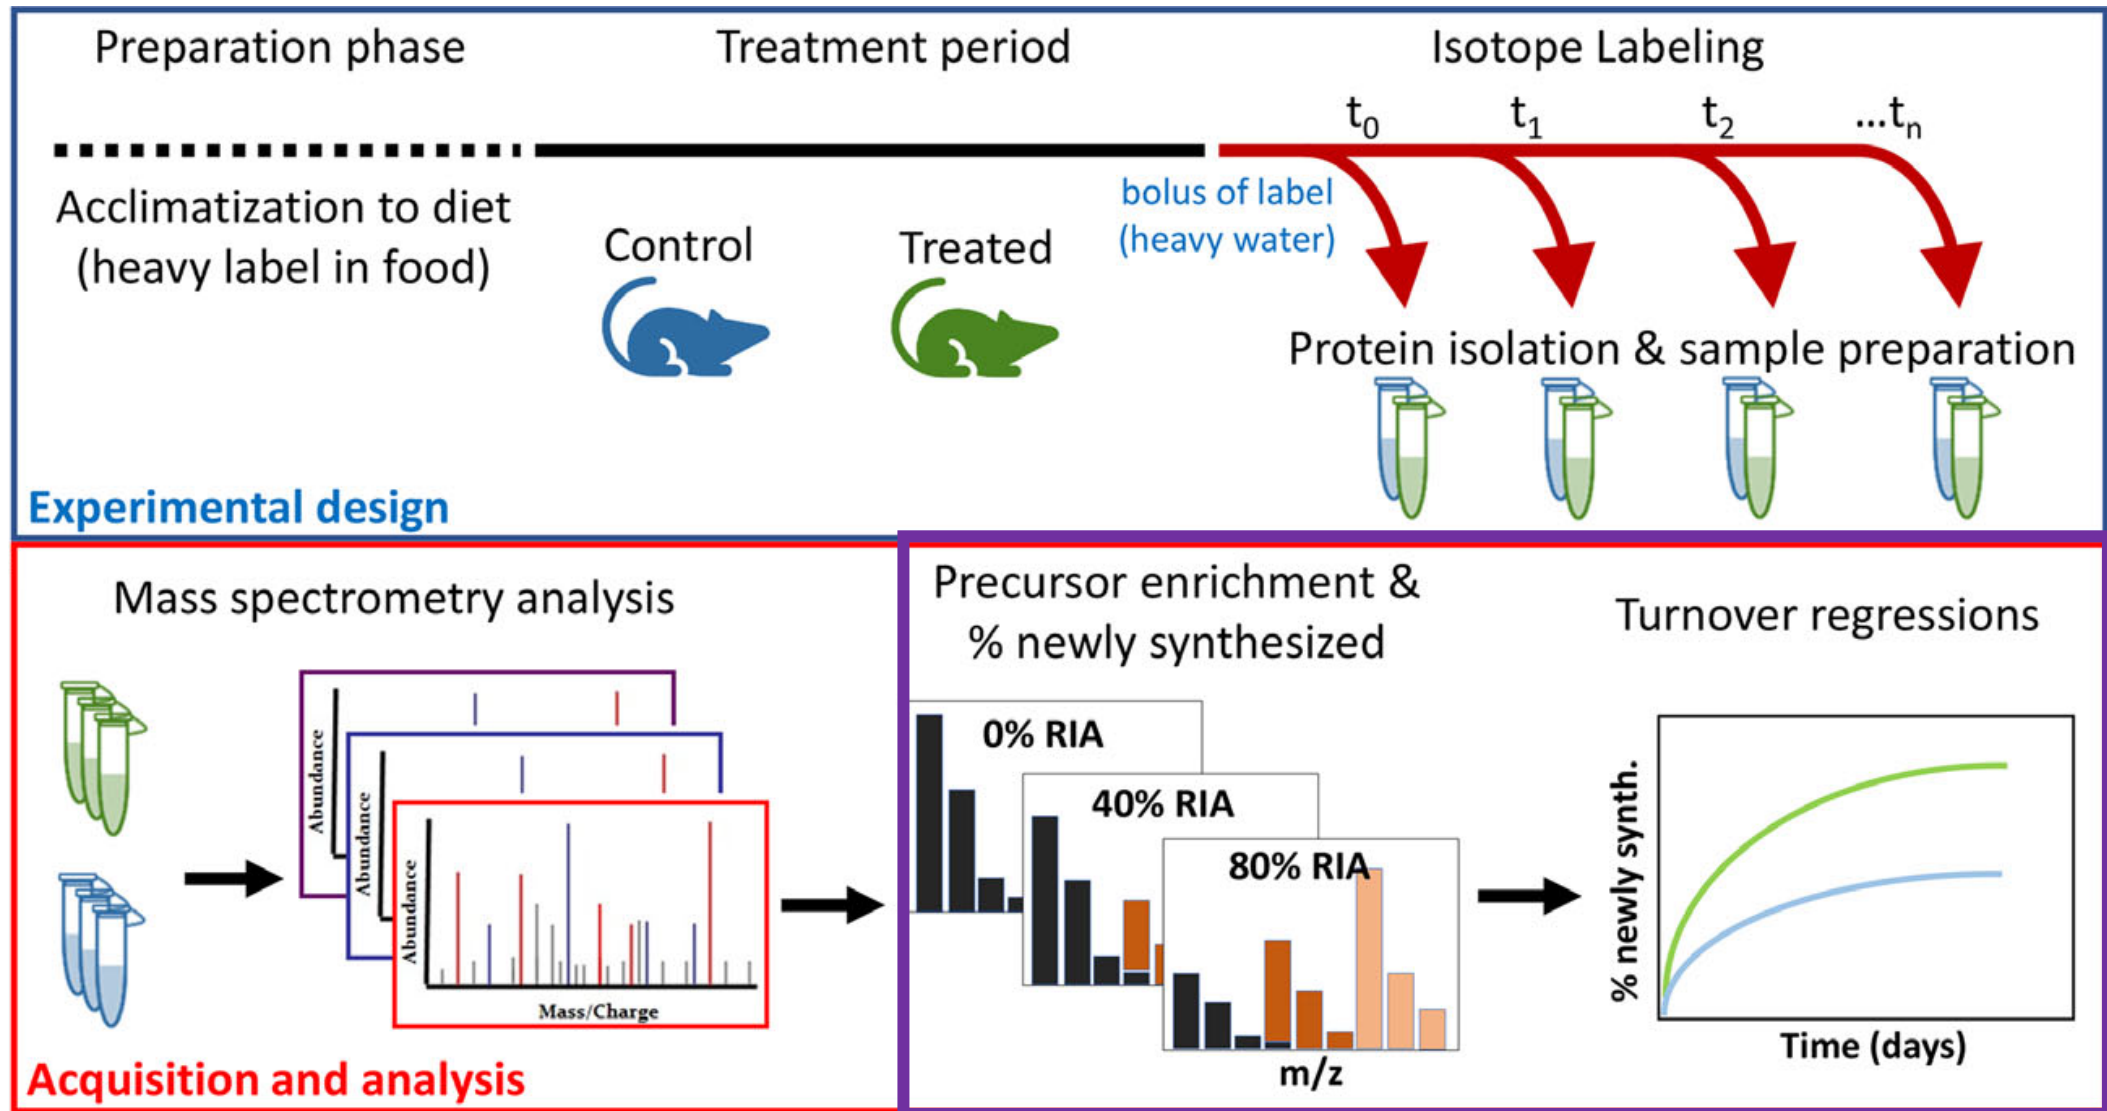

➤ [ThP 466](#) - Quantitative Proteomic Analysis of Protein Half-Lives in Senescent Cells Using Pulsed SILAC

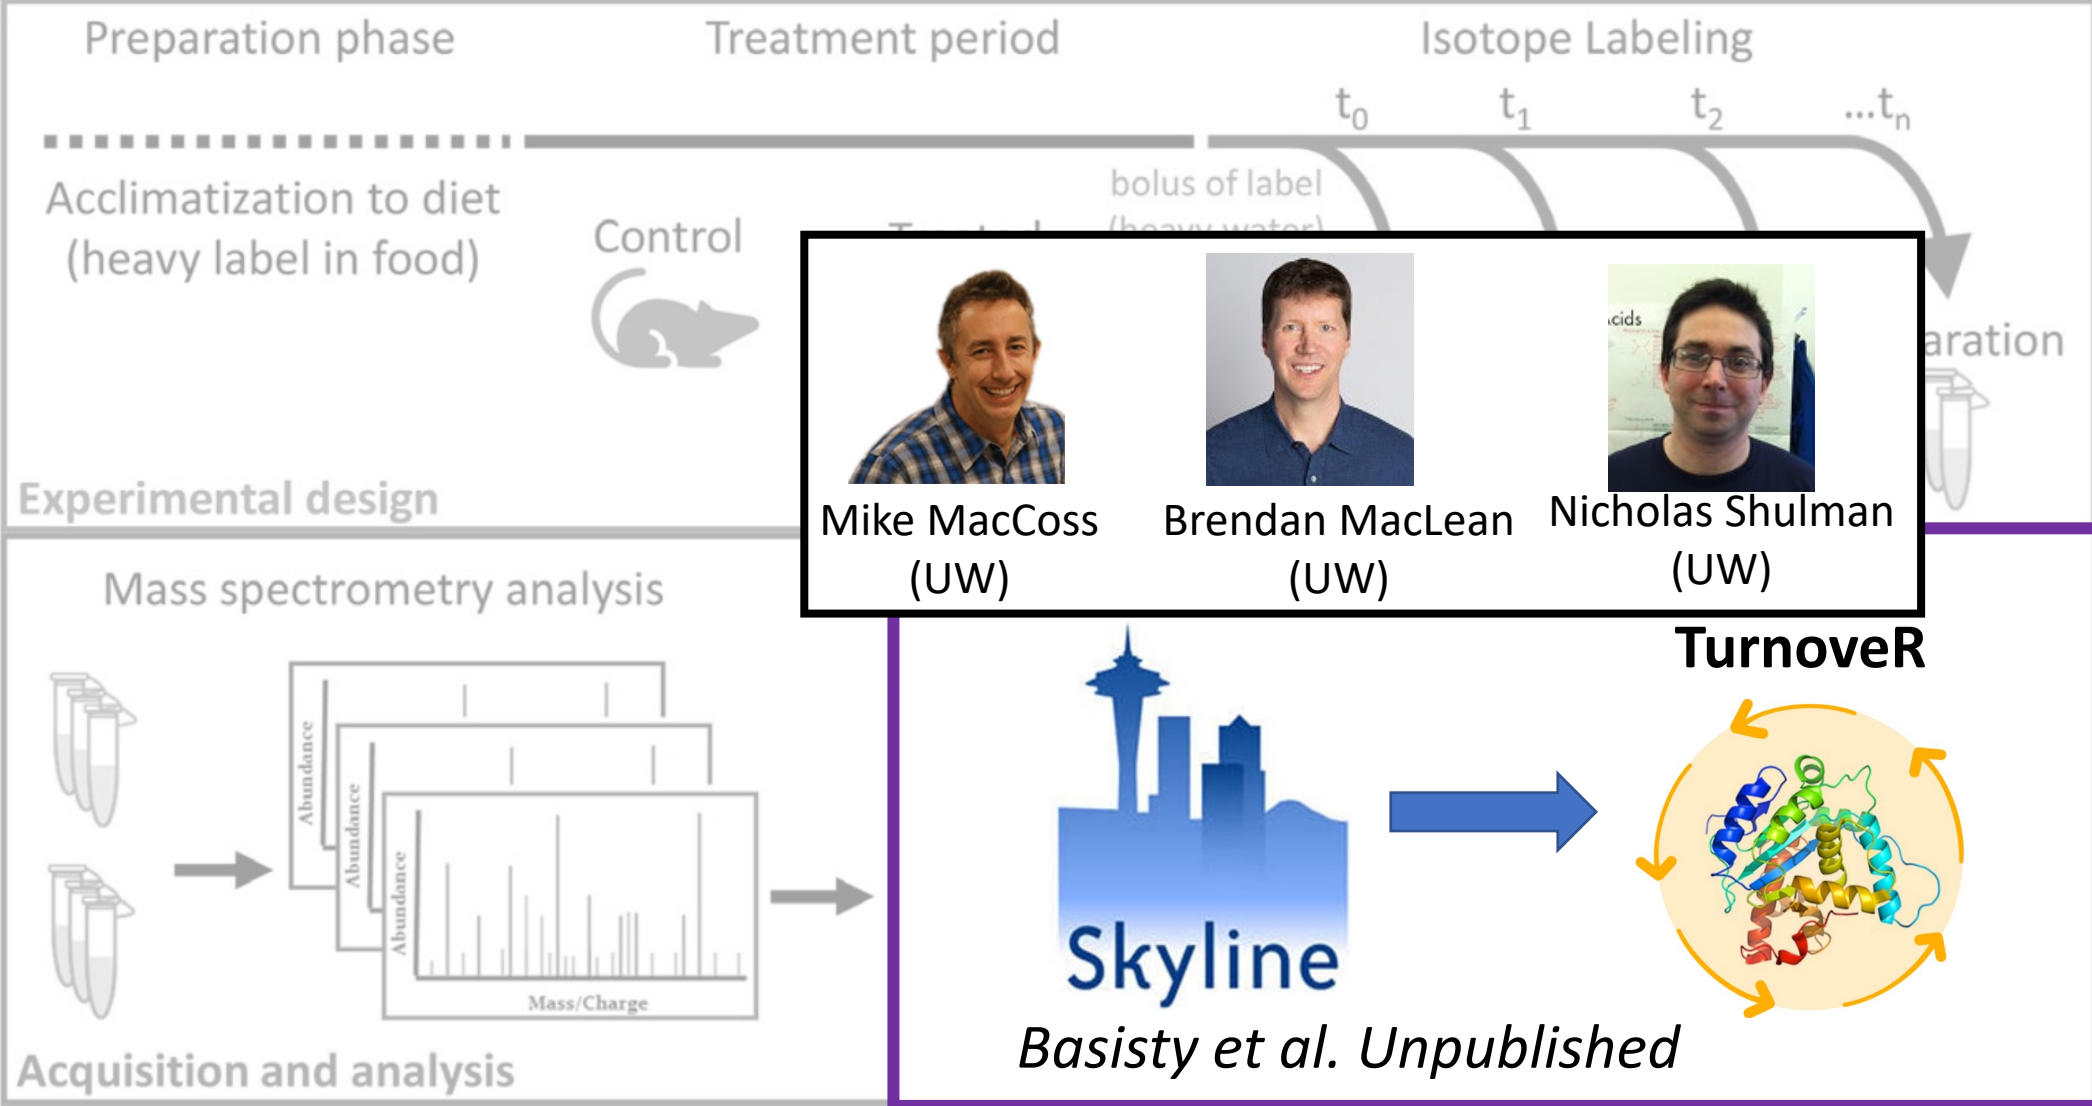

National Institute
on Aging

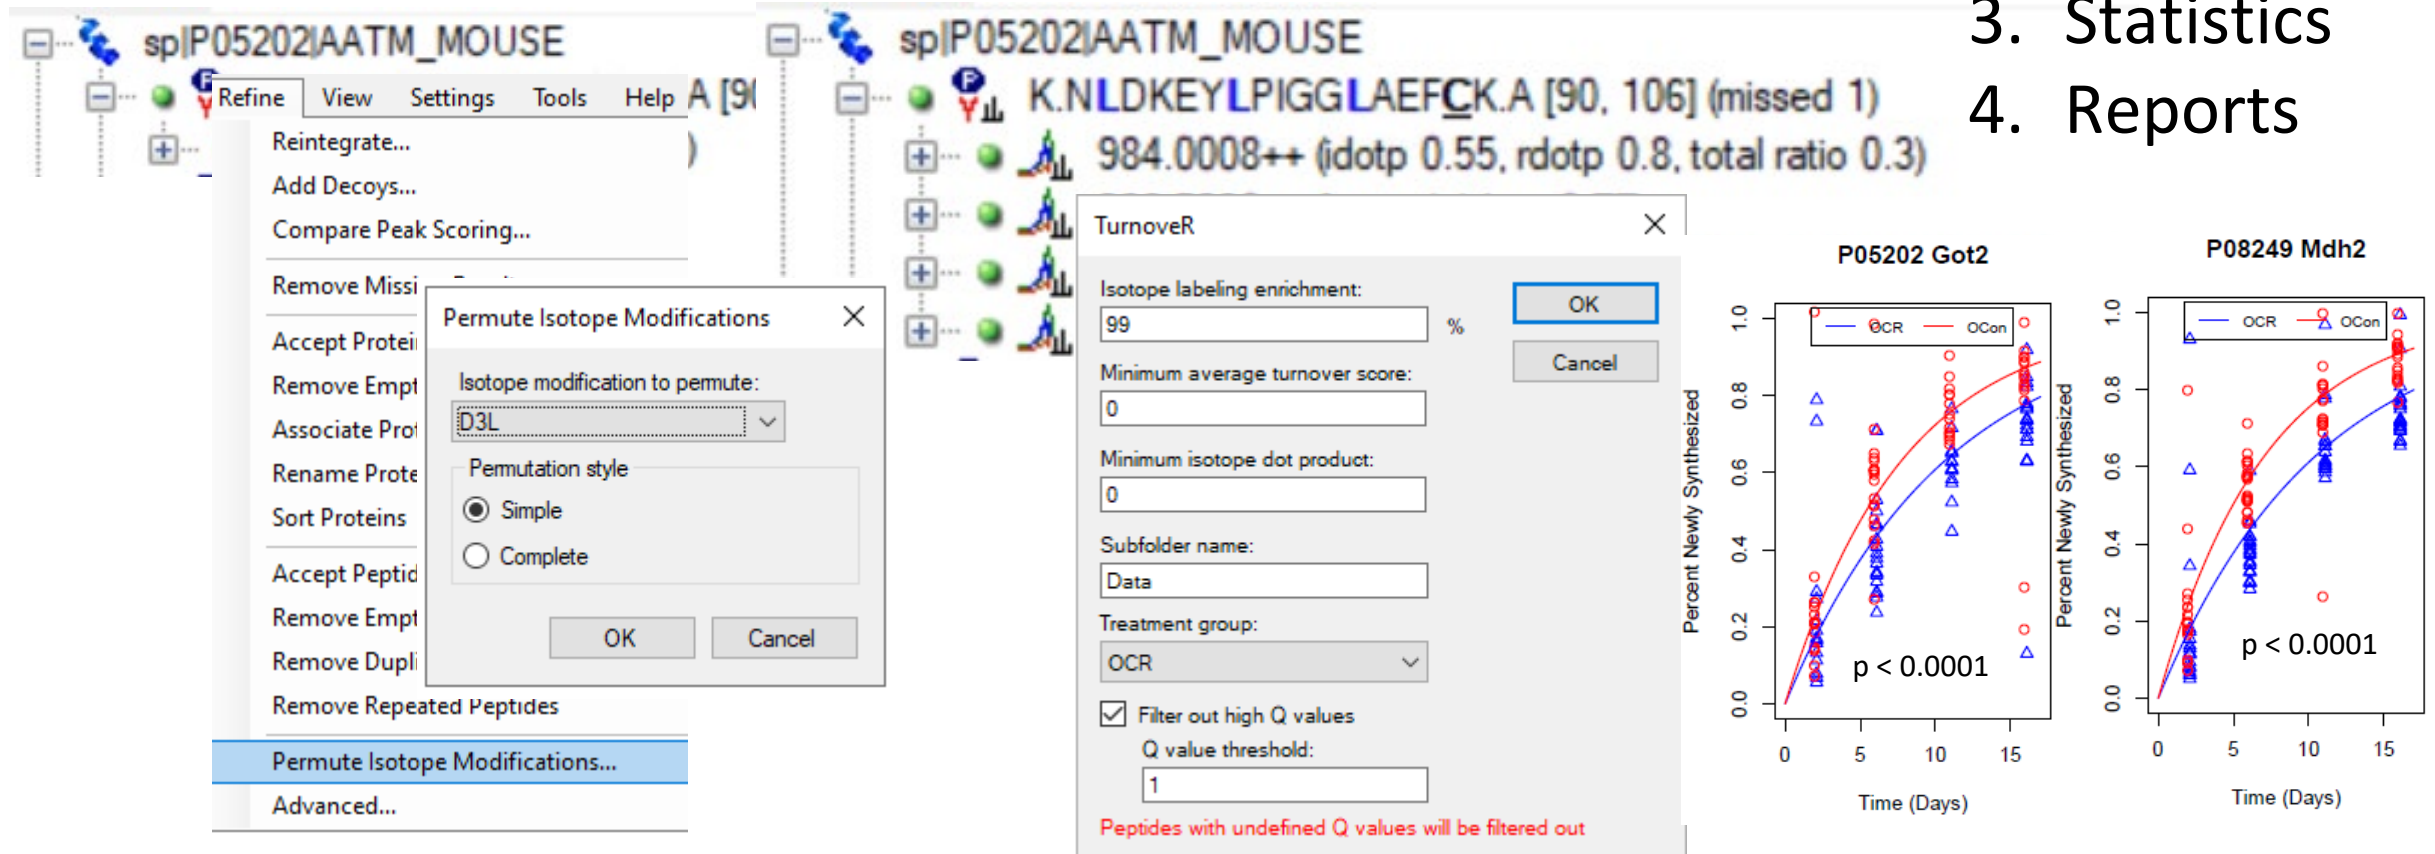

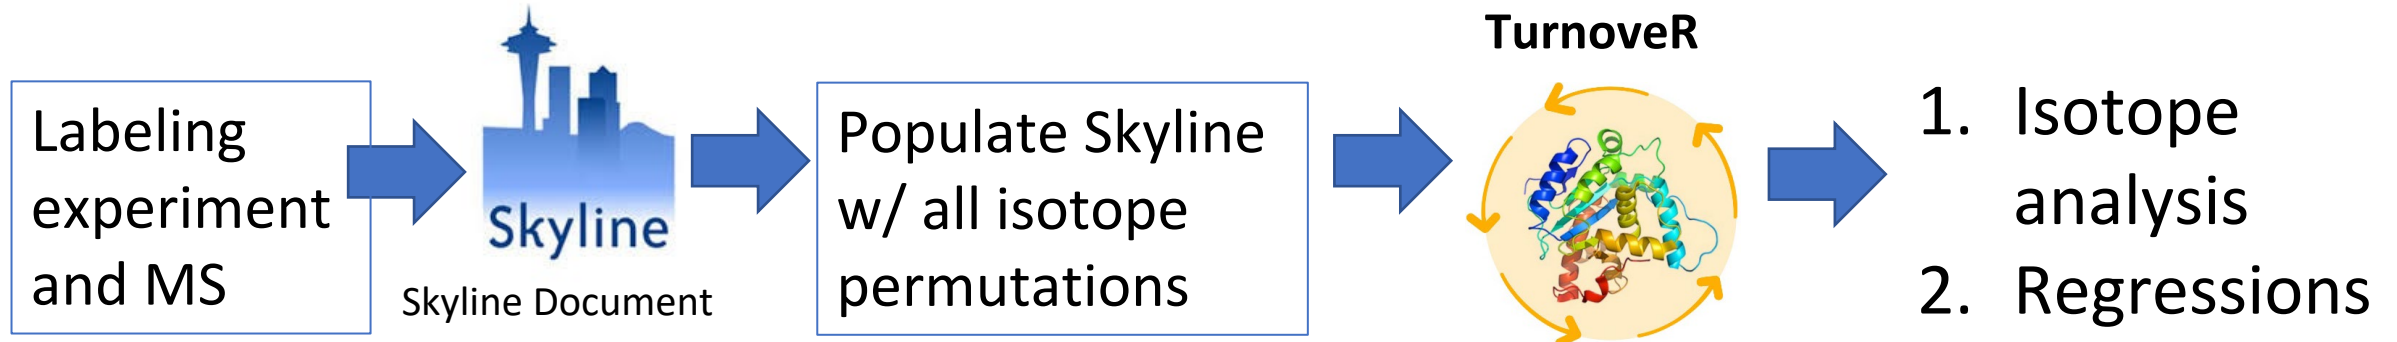

Metabolic Labeling and Mass Spectrometry Enable Comprehensive Measurement of Protein Turnover Rates

Metabolic Labeling and Mass Spectrometry Enable Comprehensive Measurement of Protein Turnover Rates

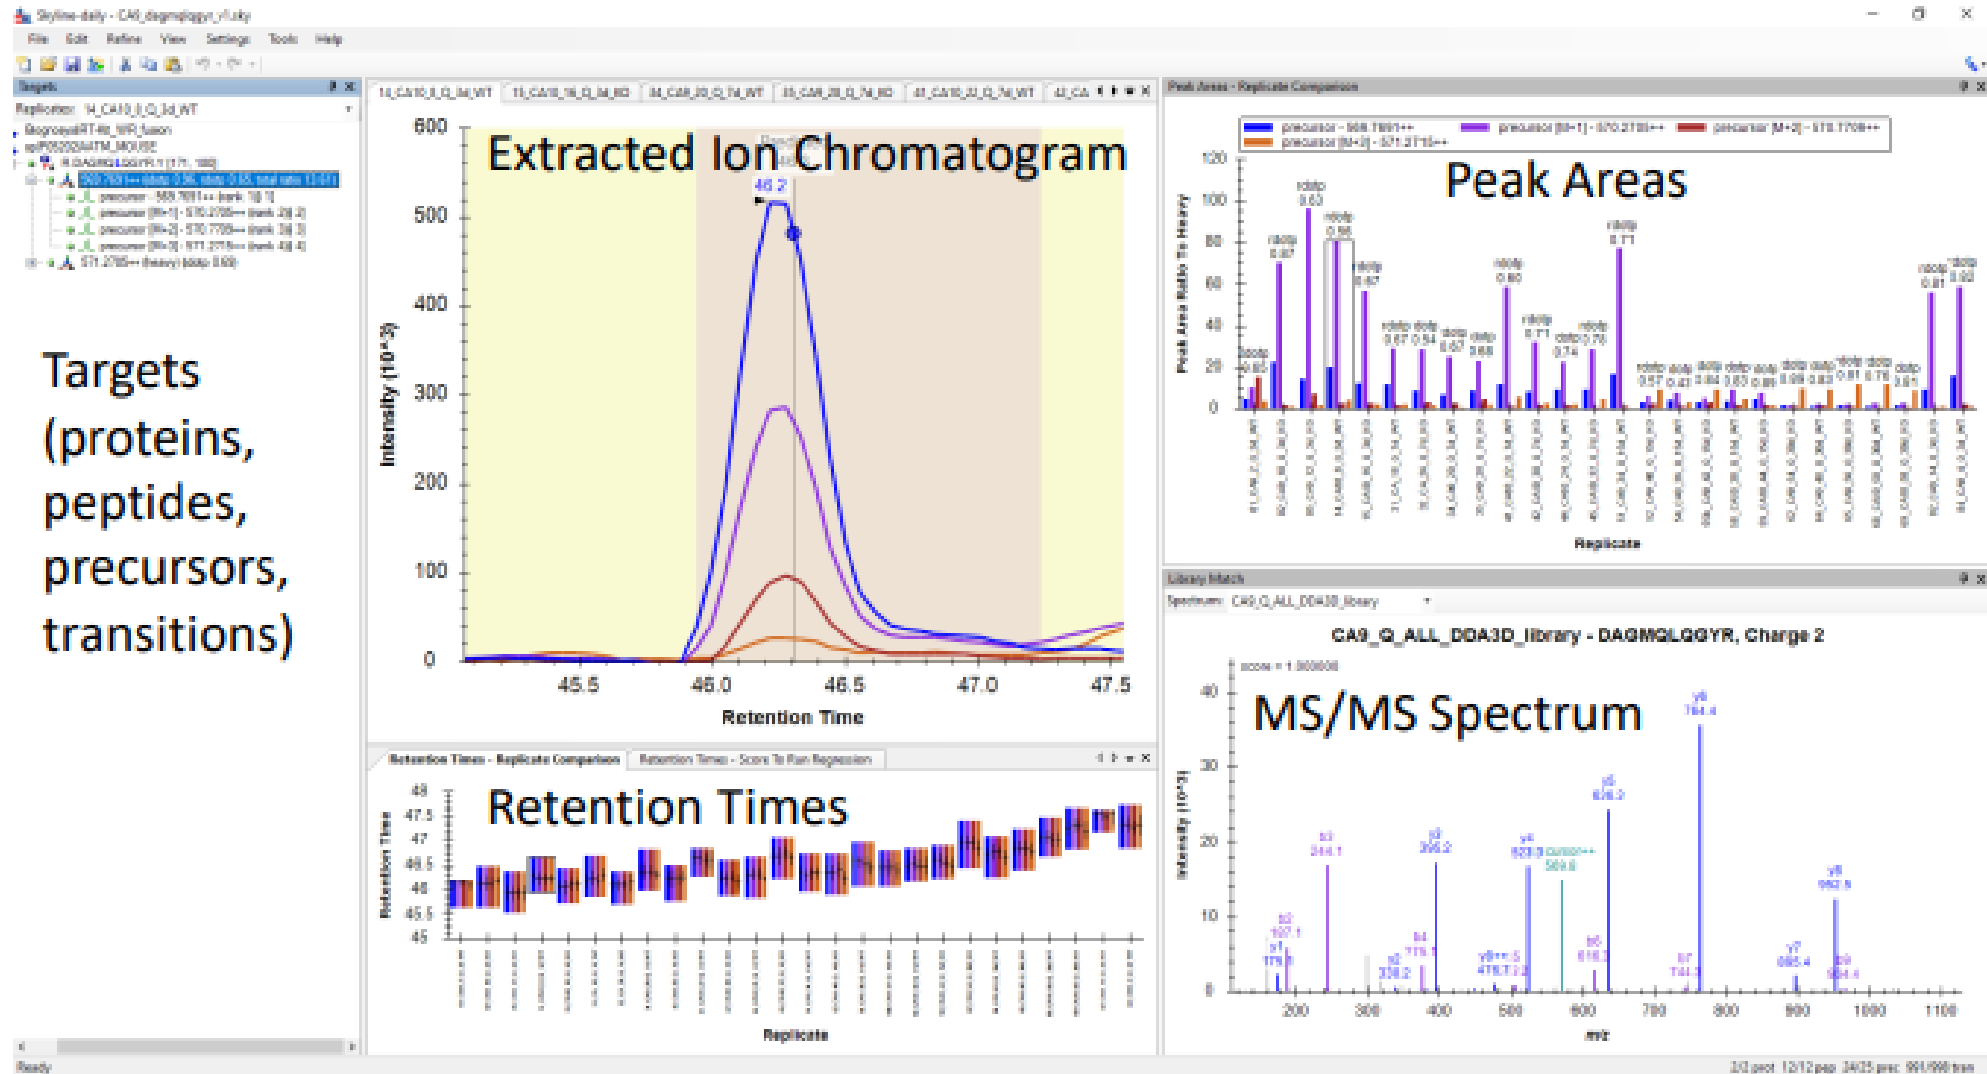

Workflow for TurnoverR: A Skyline External Tool for the Analysis of Protein Turnover from Metabolic Labeling Studies

The Interactive Visual Graphical User Interface of Skyline

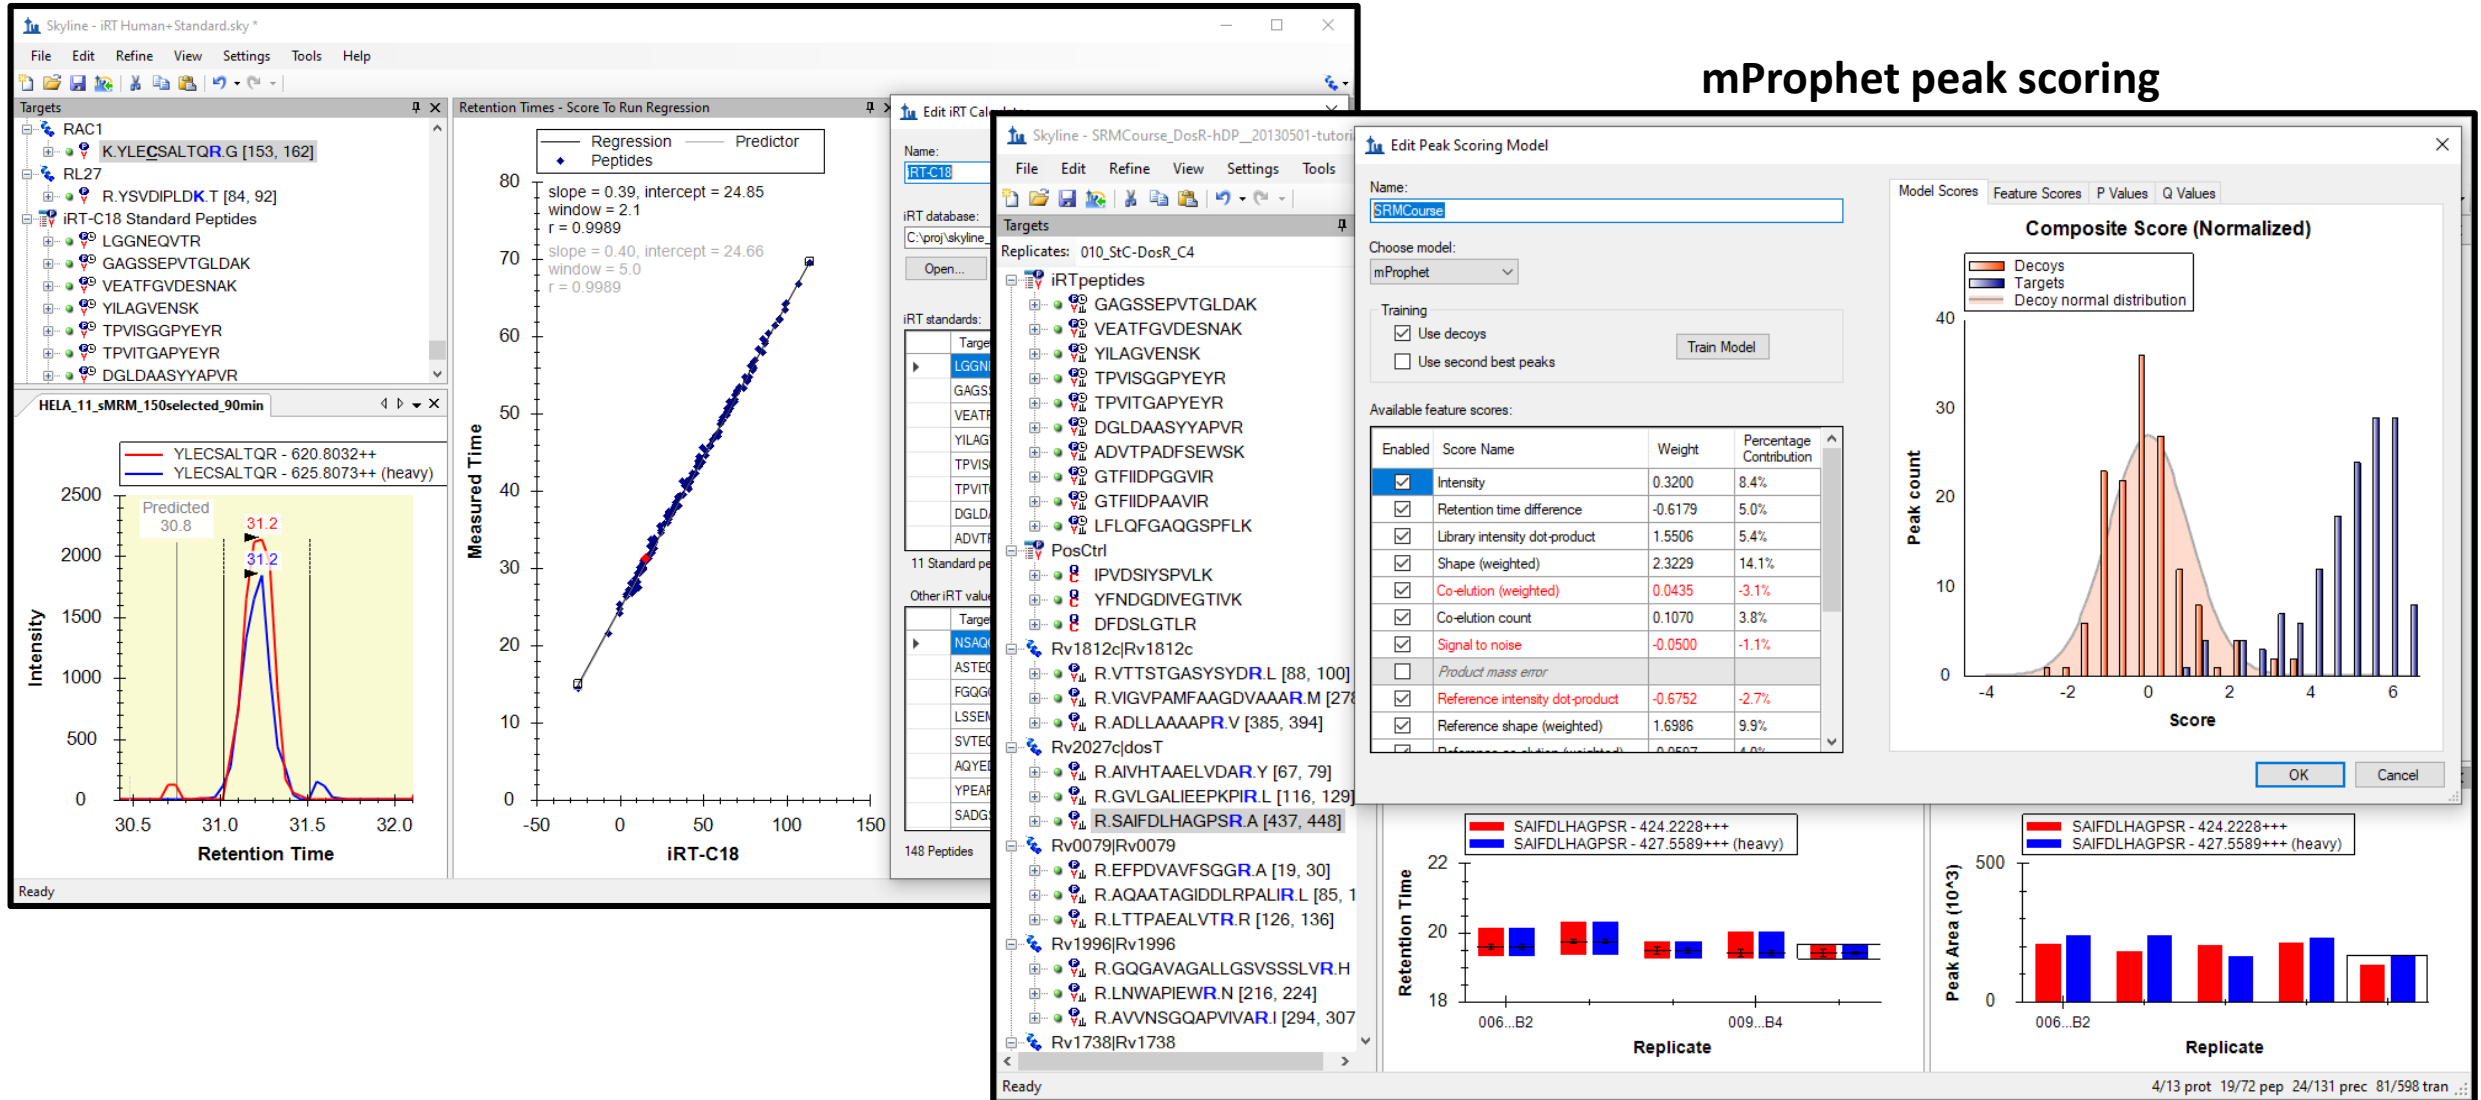

Targets
(proteins,
peptides,
precursors,
transitions)

Recommendations for Using the TurnoverR Tool in Skyline

iRT alignment

mProphet peak scoring

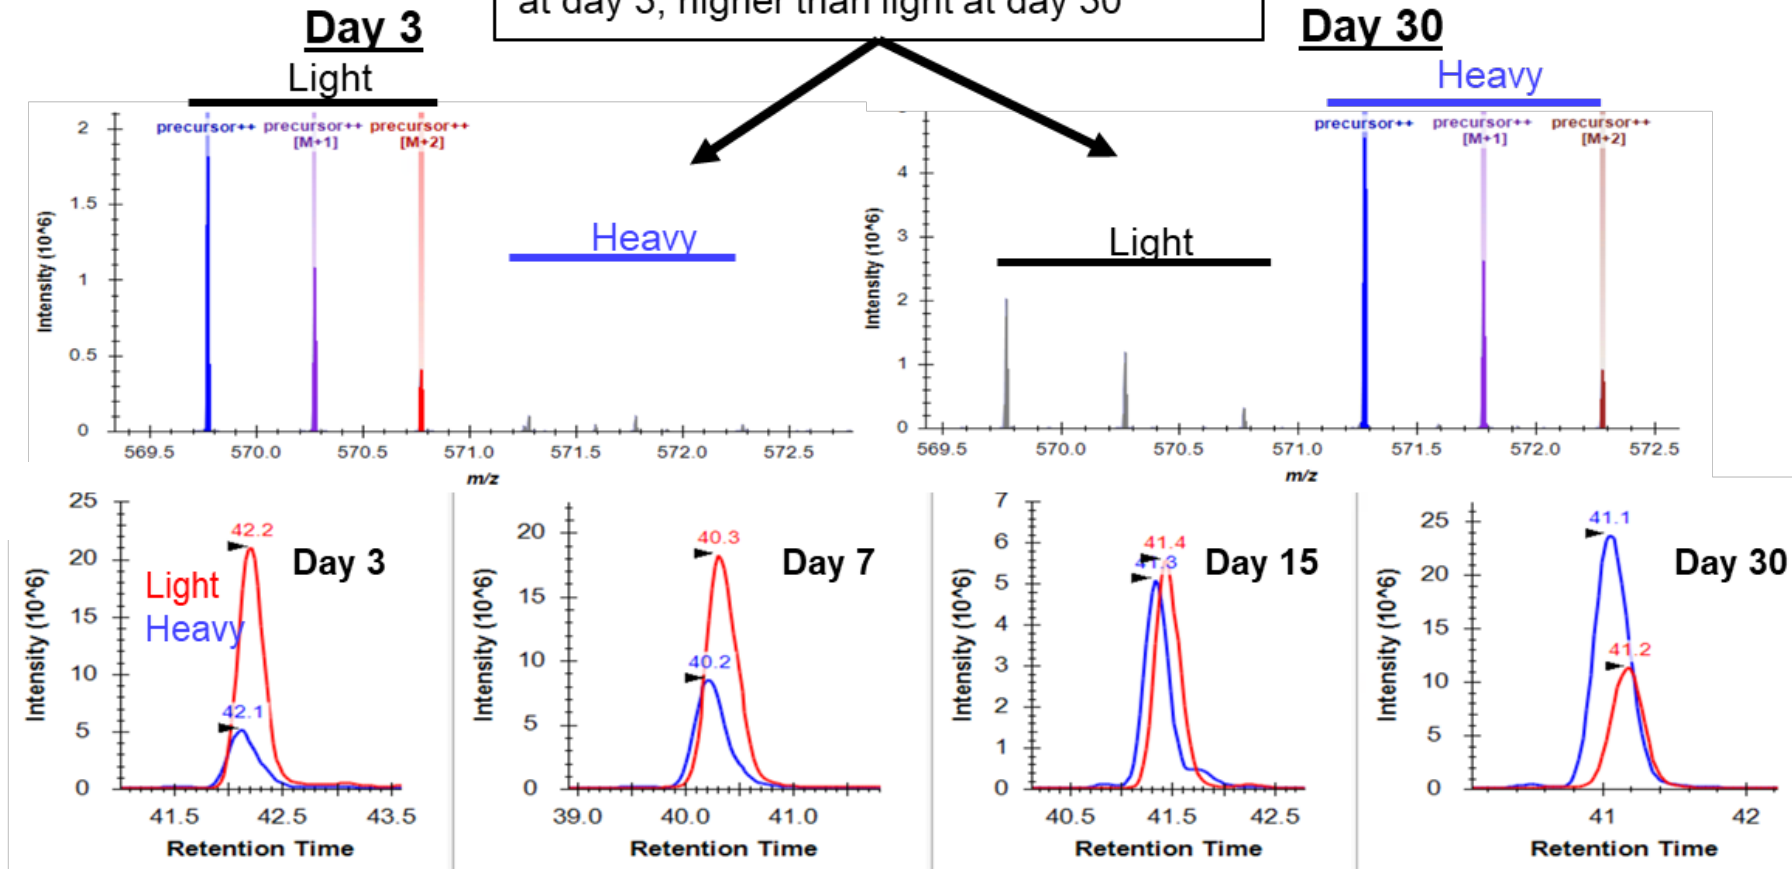

Heavy leu incorporation is observable in Skyline software

P05202 Aspartate aminotransferase, mitochondrial

Peptide: DAGMQLQGYR++

TripleTOF (Muscle)

Heavy Leu peaks lower than light peaks at day 3, higher than light at day 30

Workflow for TurnoverR: A Skyline External Tool for the Analysis of Protein Turnover from Metabolic Labeling Studies

TurnoverR Computational Pipeline

'true' isotope distributions

precursor pool enrichment

% newly synthesized

Turnover regressions
(slopes, half-lives)

Statistical comparisons
(Treated vs untreated)

TurnoverR Calculates “True Isotope Distributions”

TurnoverR Computational Pipeline

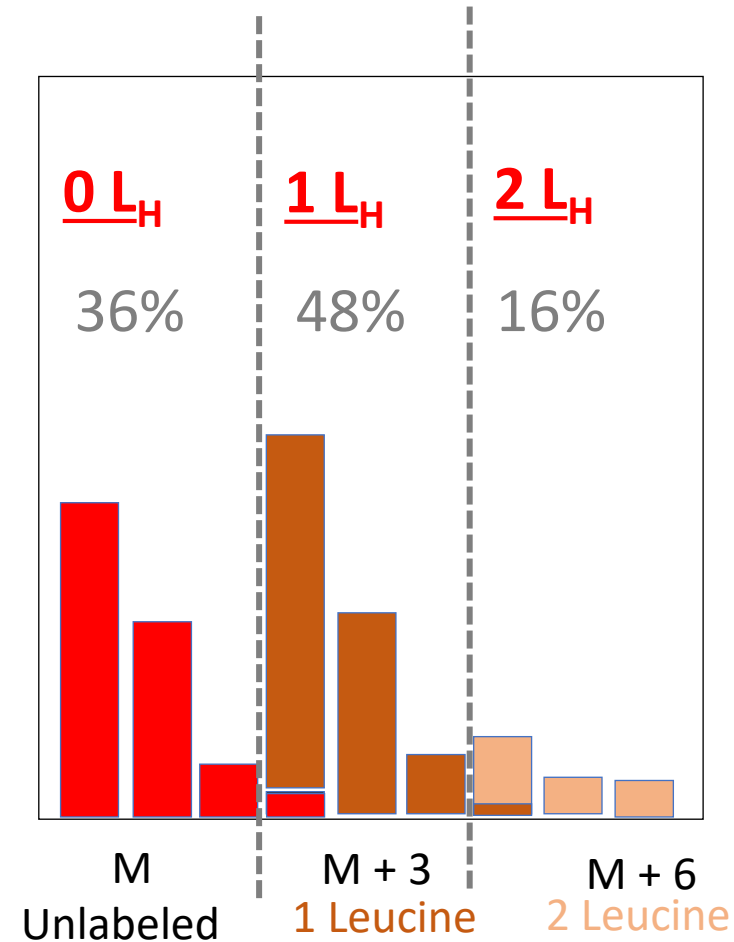

‘true’ isotope distributions

precursor pool enrichment

% newly synthesized

**Turnover regressions
(slopes, half-lives)**

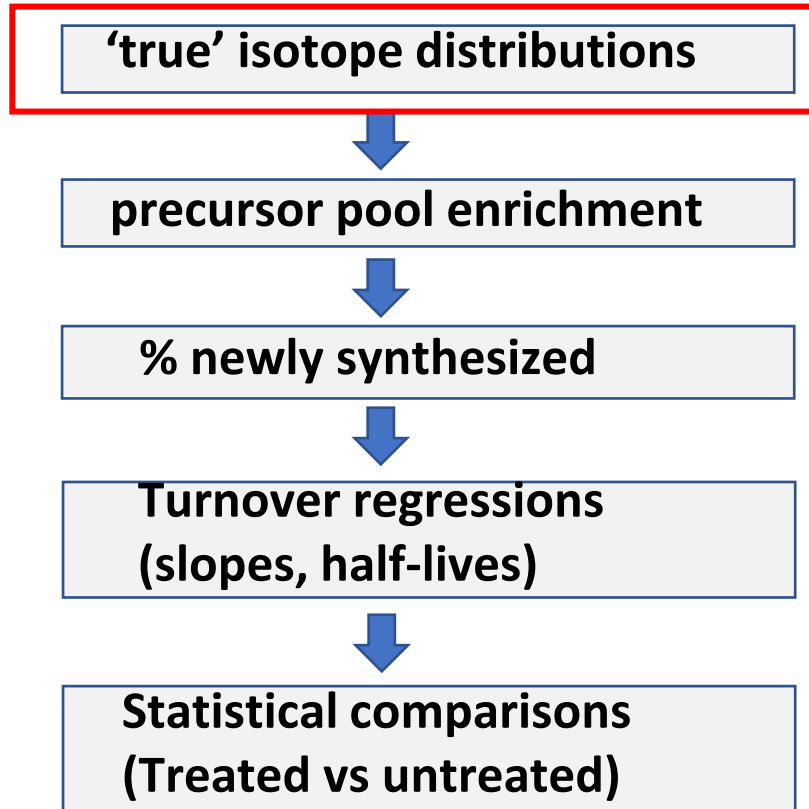

**Statistical comparisons
(Treated vs untreated)**

Isotope	% nat. abundance	atomic mass
¹ H	99.985	1.007825
² H	0.015	2.0140
¹² C	98.89	12 (formerly by definition)
¹³ C	1.11	13.00335
¹⁴ N	99.64	14.00307
¹⁵ N	0.36	15.00011
¹⁶ O	99.76	15.99491
¹⁷ O	0.04	16.99913
¹⁸ O	0.2	17.99916

TurnoverR Calculates “True Isotope Distributions”

TurnoverR Computational Pipeline

Natural isotope correction prevents systematic overestimation of heavy label enrichment

TurnoverR Calculates “True Isotope Distributions”

Precursor pool correction is required for accurate calculation of turnover

TurnoverR Computational Pipeline

'true' isotope distributions

precursor pool enrichment

% newly synthesized

Turnover regressions
(slopes, half-lives)

Statistical comparisons
(Treated vs untreated)

Protein synthesis

L_L = light leucine
 L_H = heavy leucine

40% heavy labeled

40% newly synthesized?

Precursor pool correction is required for accurate calculation of turnover

TurnoverR Computational Pipeline

'true' isotope distributions

precursor pool enrichment

% newly synthesized

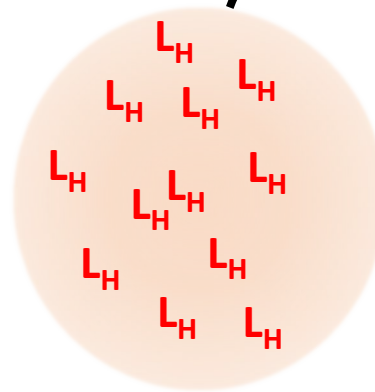

Turnover regressions
(slopes, half-lives)

Statistical comparisons
(Treated vs untreated)

Protein synthesis

100% of precursor leucines are heavy

40% heavy labeled

40% newly synthesized

L_L = light leucine

L_H = heavy leucine

Precursor pool correction is required for accurate calculation of turnover

L_L = light leucine
 L_H = heavy leucine

TurnoverR Computational Pipeline

'true' isotope distributions

precursor pool enrichment

% newly synthesized

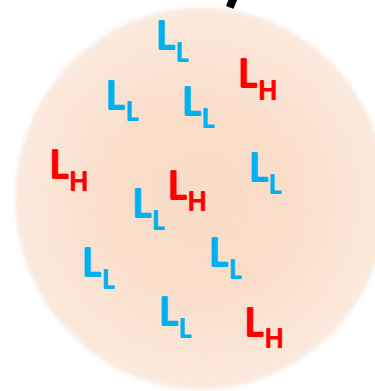

Turnover regressions
(slopes, half-lives)

Statistical comparisons
(Treated vs untreated)

Protein synthesis

40% of precursor leucines are heavy

40% heavy labeled

New protein is synthesized from a mixture of heavy and light leucine

Precursor pool correction is required for accurate calculation of turnover

TurnoverR Computational Pipeline

'true' isotope distributions

precursor pool enrichment

% newly synthesized

Turnover regressions
(slopes, half-lives)

Statistical comparisons
(Treated vs untreated)

Protein synthesis

40% of precursor leucines are heavy

40% heavy labeled

100% newly synthesized

New protein is synthesized from a mixture of heavy and light leucine

L_L = light leucine

L_H = heavy leucine

Precursor pool correction is required for accurate calculation of turnover

TurnoverR Computational Pipeline

'true' isotope distributions

precursor pool enrichment

% newly synthesized

Turnover regressions
(slopes, half-lives)

Statistical comparisons
(Treated vs untreated)

Protein synthesis

40% of precursor leucines are heavy

40% heavy labeled

100% newly synthesized

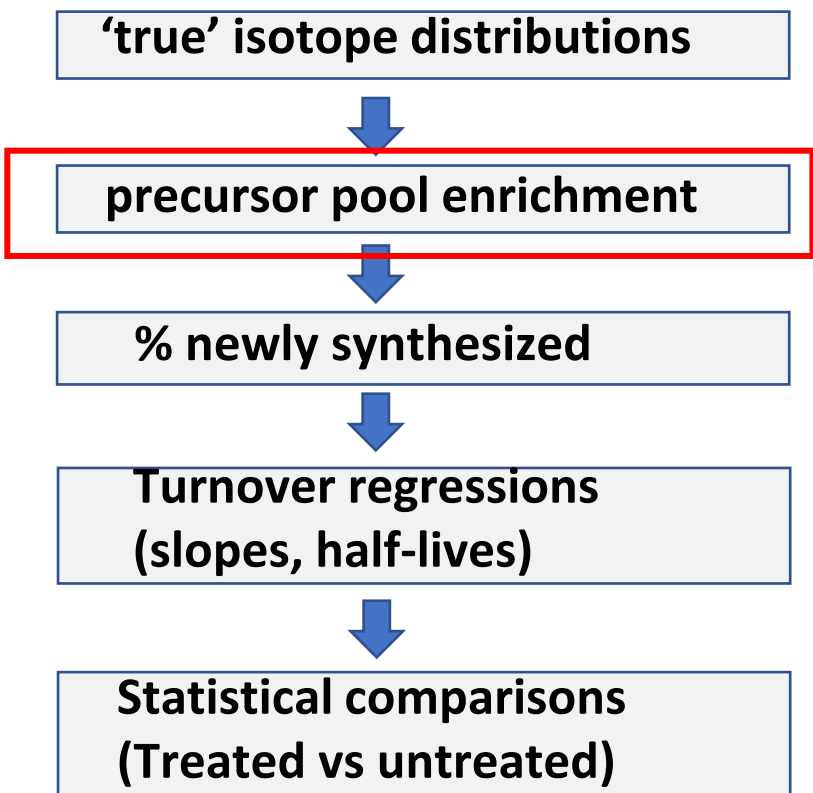

New protein is synthesized from a mixture of heavy and light leucine

L_L = light leucine

L_H = heavy leucine

Precursor pool correction is required for accurate calculation of turnover

TurnoverR Computational Pipeline

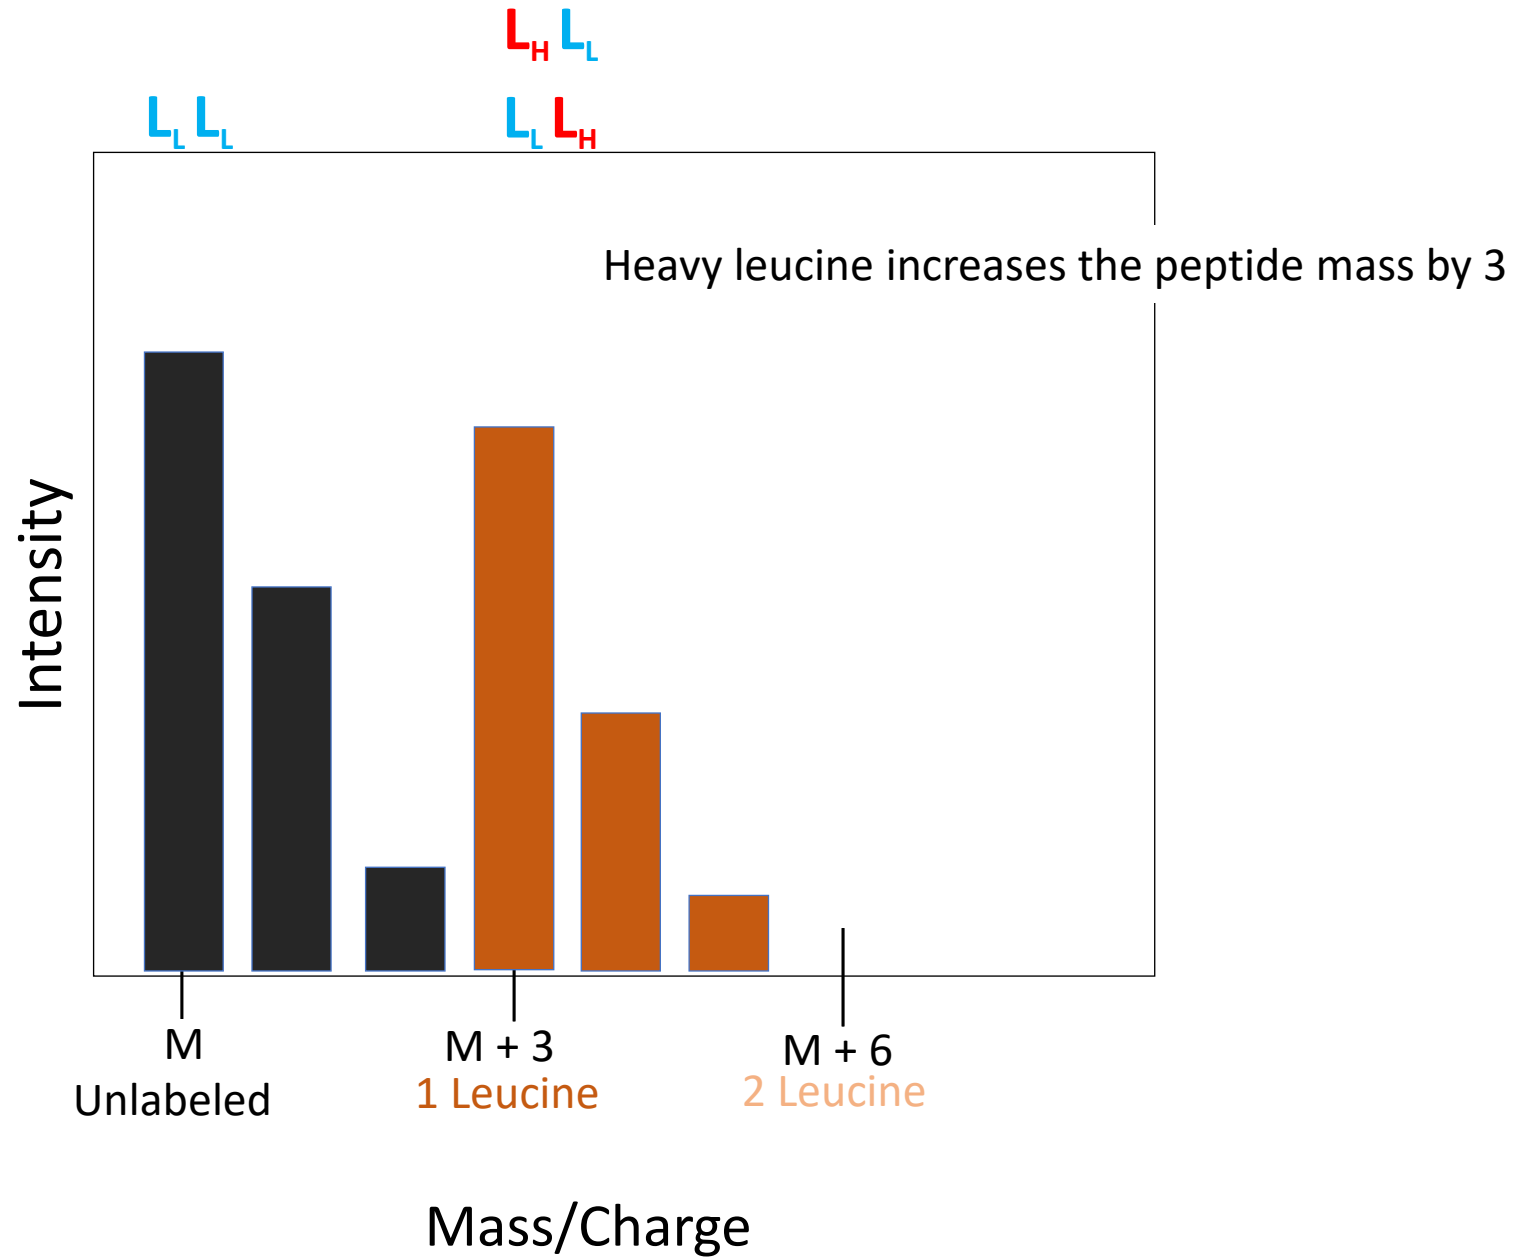

2 leucine peptide, 40% precursor pool label

-60% of new leucines will be light (L_L)
 -40% of new leucines will be heavy (L_H)

Binomial distribution calculation

Precursor Pool Estimation

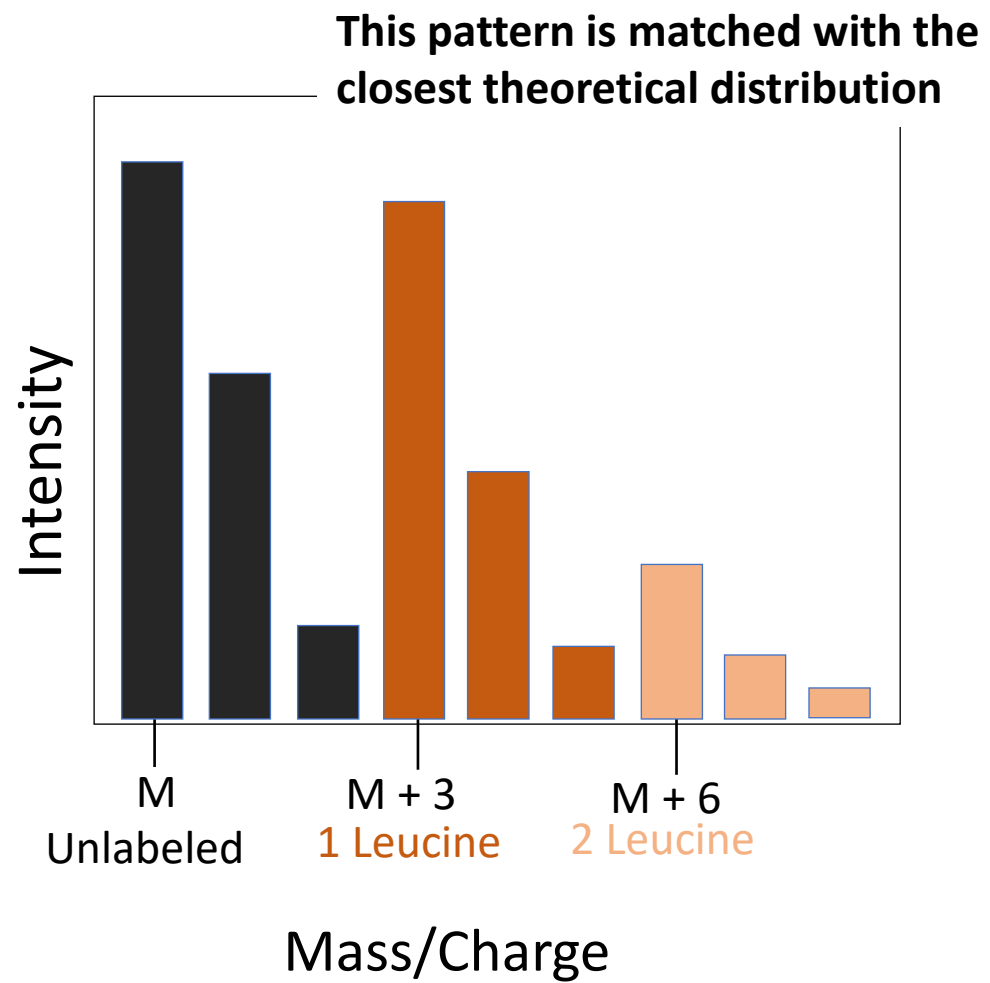

L_L = light leucine

L_H = heavy leucine

Precursor Pool Estimation

L_L = light leucine
L_H = heavy leucine

Precursor Label

0% Label

80% Label

100% Label

This peptide has:
40% Precursor Pool Label

Precursor Label

This peptide has:
40% Precursor Pool Label

$$\text{Total \% New peptide} = \frac{\text{Unlabeled} + 1 \text{ label} + 2 \text{ label}}{\text{Total}}$$

-64% of new peptide is labeled
-36% of new peptide is unlabeled

Precursor Label

0% Label

40% Label

80% Label

100% Label

This peptide has:

40% Precursor Pool Label

84% of Total Peptide is newly synthesized

Total % New peptide = $\frac{\text{Unlabeled} + 1 \text{ label} + 2 \text{ label}}{\text{Total}}$

Total

-64% of new peptide is labeled

-36% of new peptide is unlabeled

Precursor Label

0% Label

40% Label

80% Label

100% Label

Precursor pool correction is required for accurate calculation of turnover

TurnoverR Computational Pipeline

'true' isotope distributions

precursor pool enrichment

% newly synthesized

Turnover regressions
(slopes, half-lives)

Statistical comparisons
(Treated vs untreated)

Half-life without precursor RIA = 12.9 days

Always overestimated

Half-life with precursor RIA = 6 days

Precursor pool correction is required for accurate calculation of turnover

TurnoverR Computational Pipeline

'true' isotope distributions

precursor pool enrichment

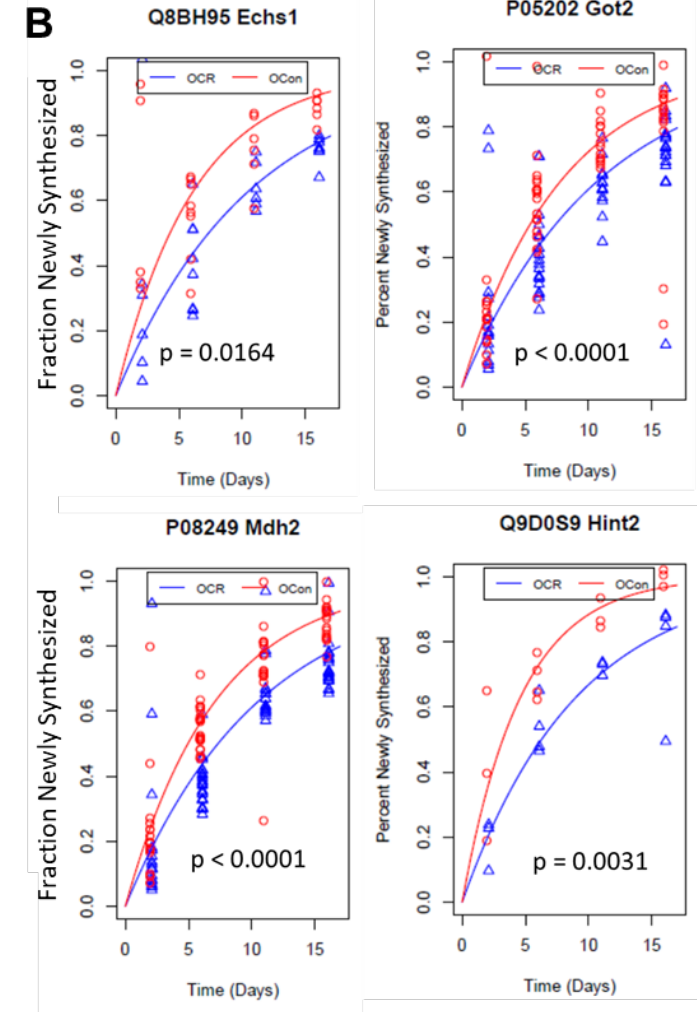

% newly synthesized

Turnover regressions
(slopes, half-lives)

Statistical comparisons
(Treated vs untreated)

CTL = Control
CR = Calorie Restricted

TurnoveR Recapitulates Results Calculated by Topograph Software.

TurnoveR

Next Steps in Method Development

- Compatibility with various metabolic labels (Heavy water)
- SILAC workflows

Outstanding Questions about Protein Turnover in Aging

- The turnover paradox of senescent cells
- How do PTMs (acylation, etc) affect protein turnover?
- Is longer half-life a biomarker for interventions that extend lifespan?
